## **S U B J E C T : Computer Oriented Numerical Methods (CONM)**

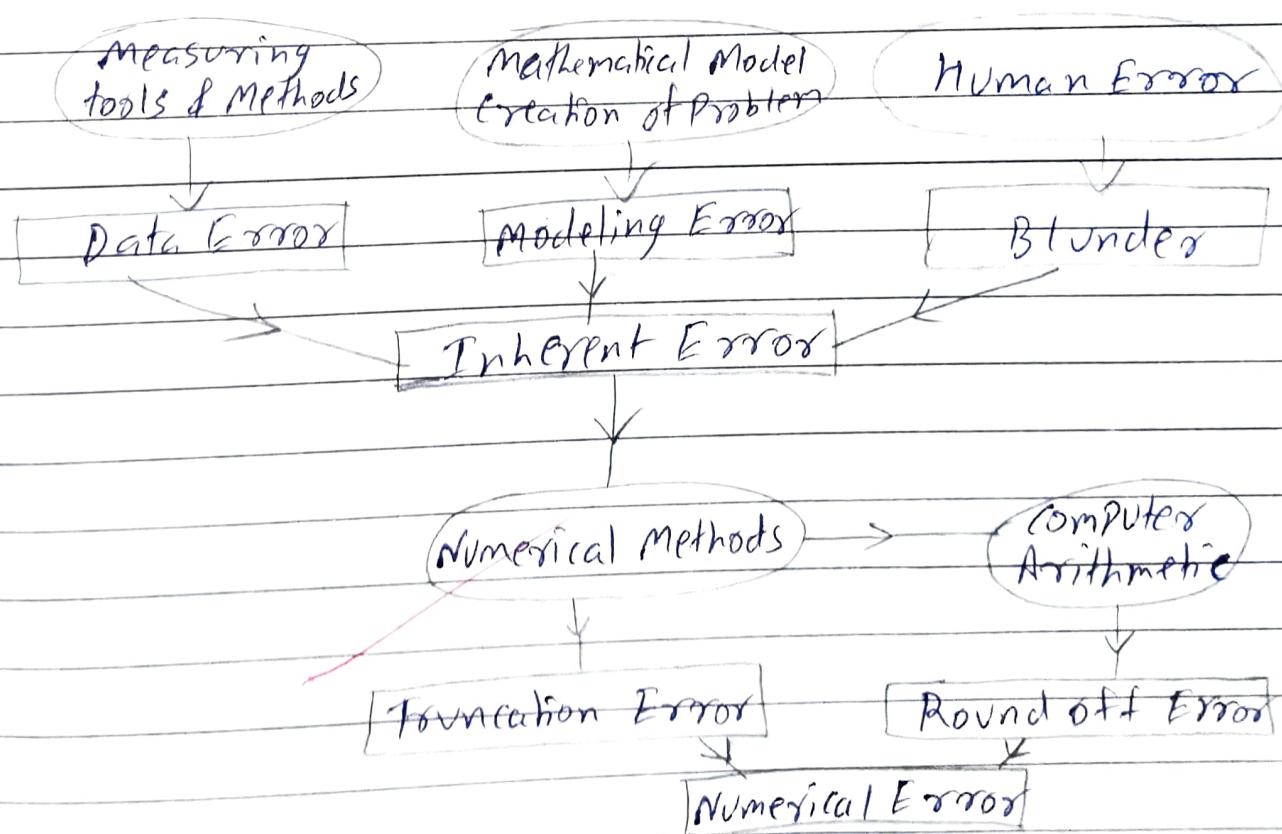

2	Evaluate the integral: integral of $dx/(1+x)$ from 0 to 1 Using (i) Simpson's 1/3 Rule correct to six decimal places (ii) Simpson's 3/8 rule correct to six decimal places		
3	A car laps a race track in 84 seconds. The speed of the car at each 6-second interval is determined by using a radar gun and is given from the beginning of the lap, in feet/second by the entries in the following table.  Time 0 6 12 18 24 30 36 42 48 54 60 66 72 78 84 Speed 124 134 148 156 147 133 121 109 99 85 78 89 104 116 123  How long is the track? Use (i) Trapezoidal Rule (ii) Simpson's 1/3 rule (iii) Simpson's 3/8 rule		
4	Write a program to solve the differential equation $dy/dx = (y-x)/(y+x)$ , where $y(0) = 1$ , using (i) Euler's method (ii) Runge - Kutta second order method in the interval 0 to 1 using step-size 0.1 Tabulate your results		
5	Find the solution of differential equation, for the range $0 \leq t \leq 1$ $dy/dt = t + (y)^{1/2}$ with $y(0) = 1$ , taking step size $h = 0.2$ using Runge-Kutta method of order 4		
6	Find the solution of differential equation $dy/dt = 1/2(t+y)$ , for $y(2.0) = 2$ , $y(0.5) = 2.636$ , $y(1.0) = 3.595$ and $y(1.5) = 4.968$ , use $h = 0.5$ using (i) Milne-Simpson's predictor corrector method (ii) Adam-Bashforth-Moulton's predictor-corrector method		
7	Use Adam-Bashforth-Moulton's predictor-corrector method to obtain the solution of the equation $dy/dx = 1-xy/x^2$ at $x = 1.4$ , where $y(1) = 1$ . Compute $y(1.1)$ , $y(1.2)$ and $y(1.3)$ using Runge-Kutta second order method. Tabulate the results obtained thus.		
8	Use Milne Simpson predictor corrector method to obtain the solution of the equation $dy/dx = 1-xy/x^2$ at $x = 1.4$ , where $y(1) = 1$ . Compute $y(1.1)$ , $y(1.2)$ and $y(1.3)$ using Runge-Kutta fourth order method. Tabulate the results obtained thus.		
9	From the following table estimate $y'(1.1)$ and $y'(1.2)$ using 3 point formulas and 5 point formulas  x 1.0 1.05 1.10 1.15 1.20 1.25 1.30 y 1.0 1.0247 1.0488 1.0724 1.0954 1.1180 1.1402		

Explain the different types of errors that occur during computation.

There are two types of errors that occurs during computation

- (1) Truncation Error
- (2) Round off Error

These two errors are being inherited by the numerical analyst are called Inherent Errors.

## Truncation Error

Truncation error is an error in implementation of numerical approximation method occurring due to truncation, a process involving infinite number of steps to finite numbers of steps, like

- (i) Limiting infinite step/series to finite number of terms
- (ii) Limiting infinite number of iterations to finite number of iteration ( $f(x)=0$ )
- (iii) Taking finite step size instead of infinitesimal step size.

## Round off error

Round off error occurs due to finite precision in a computer. A number may not always have a finite representation

$$\frac{1}{3} = 0.3333\dots$$

$$\sqrt{2} = 1.4142135623\dots$$

$$e = 2.71828182845\dots$$

Whereas, 2, 10, 9.32 have finite representation in decimal system. Moreover, a number having finite representation in one number system may not have finite representation in another number system, for example.

$$(1.1)_{10} = (1.000110011001100\dots)_2$$

One can never represent 1.1 exactly in binary system. So, let us understand first how a number is stored in a computer.

### \* Total Numerical error.

Total Numerical Error =  
Truncation error + Round off error.

The only advisable way to reduce round off errors is to increase number of significant digits. The round off error increase due to either subtractive cancellation or due to increase in the number of computations in an analysis. The truncation error can be reduced by decreasing step size. So, determining appropriate step size is essential in order to balance truncation and round off errors to minimize the total error.

Explain the Bisection method graphically.

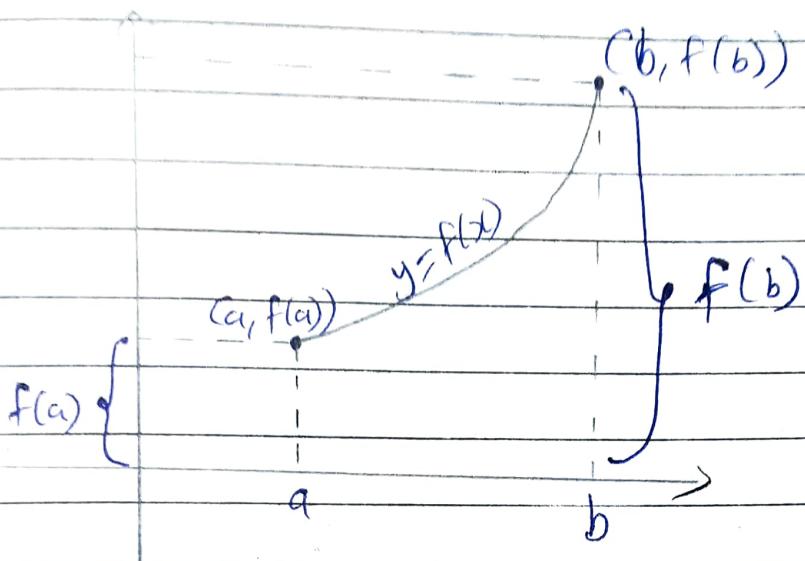

### Bisection method:

Principle on which Bisection method is based is as follows:

If  $f(x)$  is continuous in a closed interval  $[a, b]$  and  $f(a), f(b)$  are of opposite signs, then the equation  $f(x) = 0$  will have at least one real root between  $a$  &  $b$ . This is based on Intermediate Value theorem.

Let us understand it graphically in lay person terms:

Since  $f(x)$  is continuous on  $[a, b]$ , the graph of  $y = f(x)$  for  $a \leq x \leq b$  shall have no break. That is, it can be drawn from  $(a, f(a))$  to  $(b, f(b))$  without any jump.

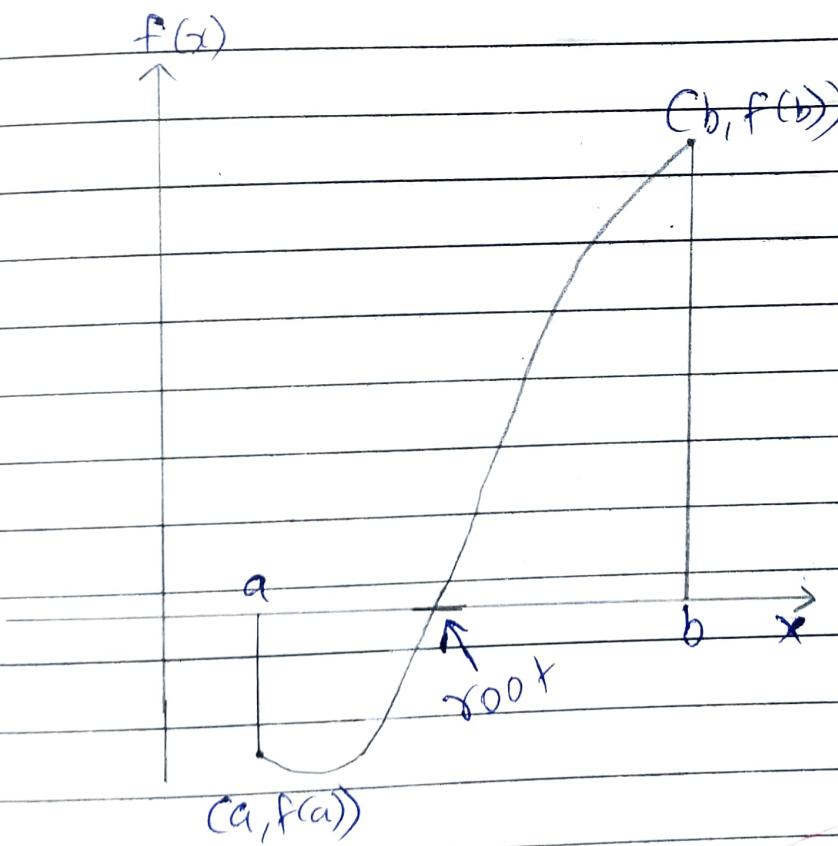

No intermediate value can be skipped.  
 Value of  $f(x)$  completely occupy the range from  $f(a)$  to  $f(b)$ .

As  $f(a)$  and  $f(b)$  are of opposite signs,  
 function has to be zero for some  
 $a \leq x \leq b$ . Moreover if  $f(a) \cdot f(b) < 0$   
 then one end of the graph is below  
 x-axis and other end is above x axis.  
 $f(x)$  being continuous, the graph of  $y =$   
 $f(x)$  has to cross x axis in going from  
 one side of x axis to the other. In  
 lay person term: It is like, if the  
 stream of river is flowing outside  
 your home and you are permitted to walk  
 only by taking infinite small continuous  
 steps, that is you are not permitted  
 to lift your legs and jump, you

cannot get inside your home from outside without making your feet wet and vice versa.

Without loss of generality, let  $f(a) < 0$ . Thus  $f(b) > 0$ .

Explain the advantages and disadvantages of Bisection Method.

### Advantages of Bisection Method

- ① It is very simple
- ② Once initial  $a, b$  are known, number of iterations needed to be performed to achieve desired accuracy can be predetermined.
- ③ Reliable
- ④ It guarantees convergence.
- ⑤ Function needs to be only continuous.
- ⑥ Only one function evaluation per iteration.
- ⑦ Calculation for making guess of root for the next iteration is very easy.  
Simply  $c = \frac{a+b}{2}$ .

## Disadvantages of Bisection Method

- ① Not self starting. To begin with, requires two initial guesses at which function must of opposite sign. Thus, one has to evaluate function at subinterval points to get such 'a' and 'b'.
- ② slowest method.
- ③ It does not take into account the natural nature of function to make next guess of the root.

Find the root of the following using Bisection method.

(a)  $f(x) = x^3 - x - 1 = 0$

Explain False position or Regula falsi method graphically.

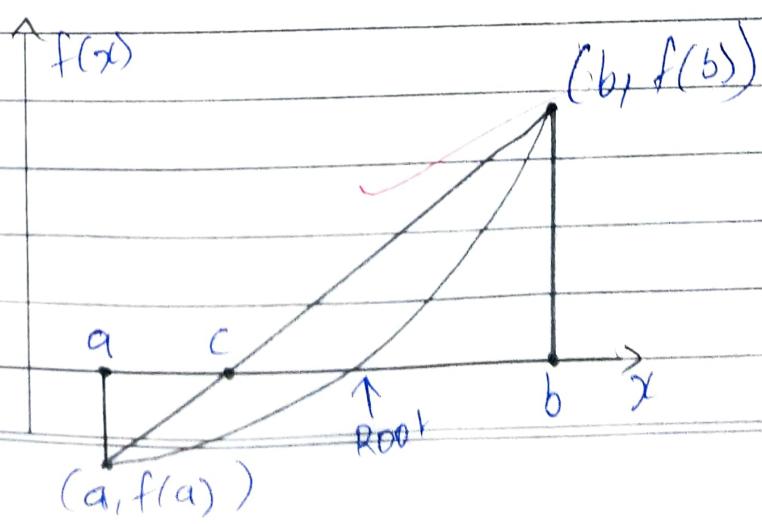

In Regula falsi method, to take into consideration the function value at 'a' and 'b', straight line is drawn, joining  $(a, f(a))$  and  $(b, f(b))$

→ The point, where it cuts x-axis, is the new estimate of the root.

→ Mathematically, estimate of formula for 'c' can be derived as follows:-

$$c = \frac{a \cdot f(b) - b \cdot f(a)}{f(b) - f(a)}$$

→ If  $f(c) = 0$ , 'c' is the root otherwise if  $f(a) \cdot f(c) > 0$ , 'c' takes the role of 'a' otherwise 'c' takes the role of 'b'

Q1

What is the need of numerical Integration? Explain different situations where such need arises.

Ans

In integration, whenever anti derivative is known indefinite integral is known. The difficulty arises in computing definite integral in many situations owing to different reasons.

$\Rightarrow$  Situation 2:

For evaluating  $\int_a^b f(x) dx$ , anti derivative of  $f$  exists but cannot be represented in a form of standard functions. For example, consider

$$\text{i)} \int_0^1 e^x dx \quad \text{f(2)} \int \frac{dx}{\log x}$$

One may say, anti derivative of  $e^x$  is  $\int e^t dt$ , but is not of no use to us. Both these stated integrals have precise numerical values. For all practical purposes, anti-derivation cannot

be used to calculate the values & and thus the definite integral cannot be determined.

Many such examples are encountered in scientific, mathematical & statistical and engineering problems at -

① The error function :

$\text{erf}(x) = \frac{2}{\sqrt{\pi}} \int_0^x e^{-t^2} dt$ , used in calculating error bounds in many computations is of great importance in statistics. ② Whereas  $\sum_{n=1}^x \frac{dt}{\ln(n)}$  is logarithm function, which gives approximately number of primes less than or equal to  $x$ .

③ In electric field theory, it is proved that the magnetic field induced by a current flowing in a circular loop of wire has intensity.

$$H(x) = \frac{hly}{r^2 - x^2} \int_0^{\frac{\pi}{2}} (1 - (\frac{x}{r})^2 \sin^2 \theta)^{-\frac{1}{2}} d\theta$$

- where  $I$  is the current,  $r$  is the radius of the loop,  $x$  is the distance from center to the point, where the magnetic intensity is being computed ( $0 \leq x \leq r$ ). If  $x, r$  and  $I$  are given, the integral occurring in the equation is called elliptic integral and cannot be expressed in terms of standard form.

- All three integrals are frequently occurring integrals and we shall learn numerical methods called methods of numerical integration. Using these methods, we would be able to evaluate these integrals to as many decimal places as desired.

$\Rightarrow$  Situation 2 :-

Anti-derivative may exist known but may be complicated expression to compute. In these cases, rather than evaluate anti-derivative, it is preferred to use numerical integration formula to

evaluate the integral. A typical situation could be where anti-derivative expression is in the form of an infinite series or infinite product and its evaluation requires numerical techniques.

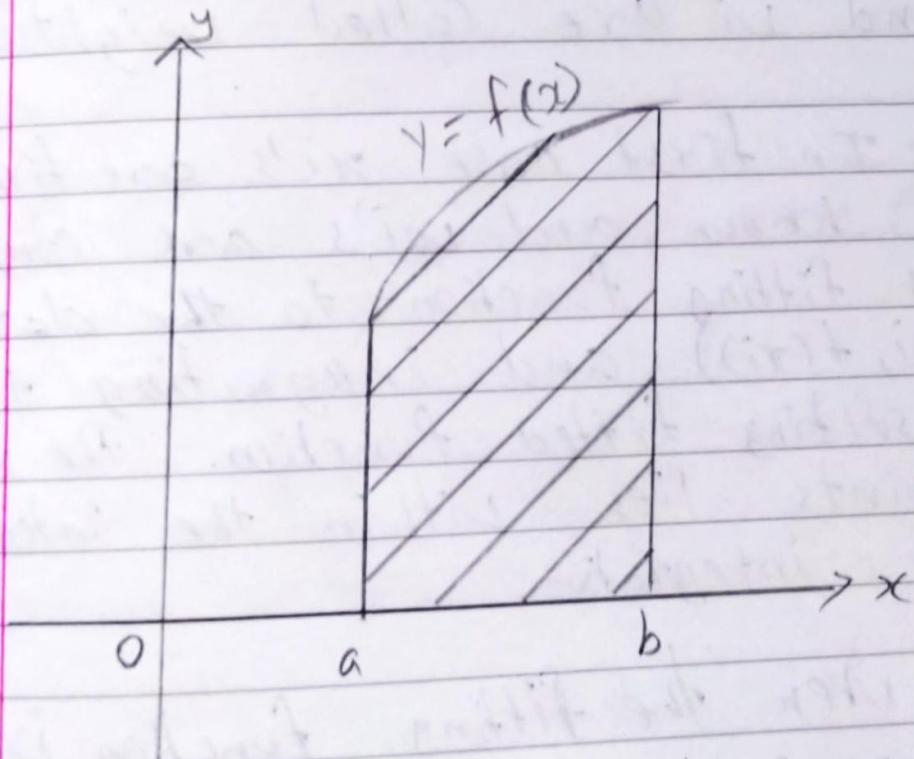

$\Rightarrow$  Situation 3 :-

Expression of function to be integrated is not available functions are defined with the help of discrete data. For example, speed of an object may have been measured at different time intervals and distance needs to be computed or integrated may have been obtained by sampling. So values are available at certain points only.

Q2 Give geometrical interpretation of  $\int_a^b f(x) dx$ ,  
with  $f(x) > 0$  and  $a \leq x \leq b$ .

Ans

The definite integral  $\int_a^b f(x) dx$  of a non-negative integral  $f(x)$ , on a closed interval  $[a, b]$  area under the graph of  $f$ .

Q3

Differentiate between:

- (a) Newton Cotes Integration formulas and Gauss Quadrature formulas.
- (b) Closed type and Open type formulas.

Ans.

(a) Here  $x_i$  are called Abscissas and  $w_i$  are called weights.

- In first case  $x_i$ 's are fixed, that is known and  $w_i$ 's are computed by fitting function to the data  $(x_i, f(x_i))$  and integrating the resulting fitted function. The  $x_i$ 's points lies within the interval  $[a, b]$  of integration.

- When the fitting function is a polynomial, the integration formulas so obtained are called Newton Cotes Integration formulas.

- On the other hand, if  $x_i$ 's and  $w_i$ 's both are assumed to be unknown and they are computed, the formulas so obtained are called Gauss Quadrature formulas.

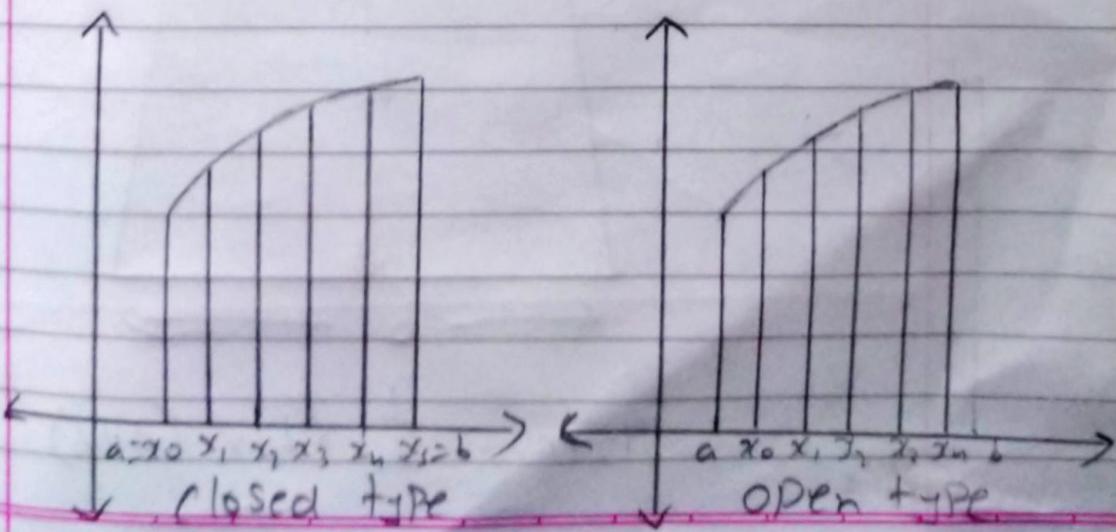

## Integration formulas

$x_i$ 's fixed  
 $v_i$ 's unknown  
 Newton Rotes Integration formula

$x_i$ 's unknown  
 $v_i$ 's unknown  
 Gauss quadrature formula.

### b) Closed type and open type formulas.

- If  $x_0 \geq a$  and  $x_n \leq b$ , i.e.,  $a \geq x_0 \leq x_1 \leq \dots \leq x_{n-1} \leq x_n \leq b$  then integration formula is called closed type integration formula.
- If  $a < x_0 < x_1 < x_2 < \dots < x_{n-1} < x_n < b$  then the integration formula is called open type integration formula.

Qn Explain trapezoidal rule for estimating  $\int_a^b f(x) dx$ . Explain it graphically also.

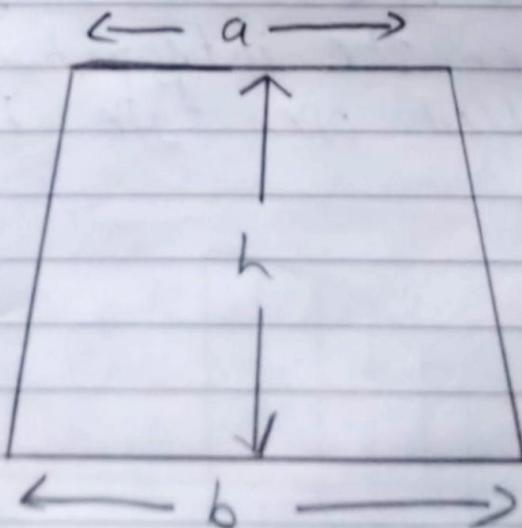

Ans

By trapezoidal rule.

$$\frac{\Delta x}{2} [f(a) + f(b)]$$

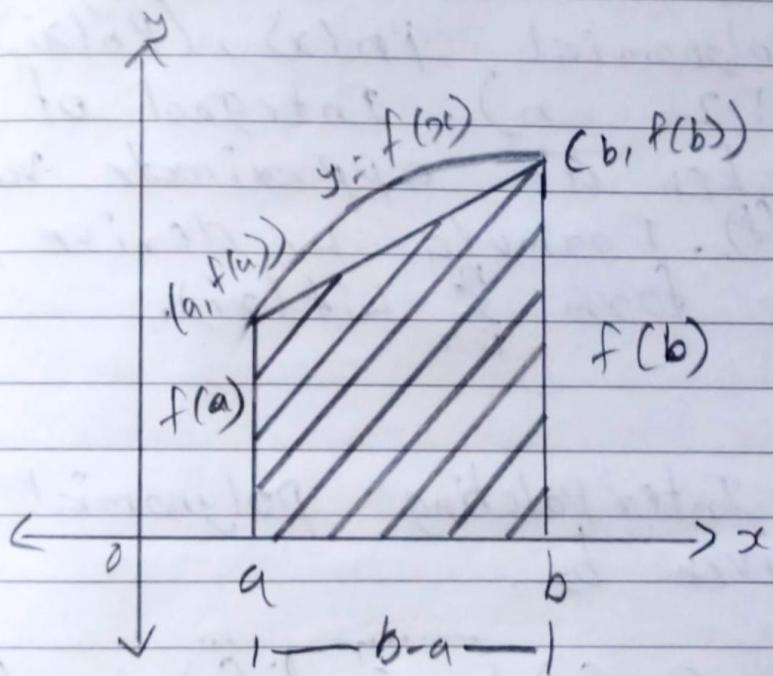

$$\int_a^b f(x) dx =$$

→ This rule is called trapezoidal rule as it gives area of trapezium formed from joining the points  $(a, f(a))$  and  $(b, f(b))$  by a straight line and the vertical lines  $x=a$  and  $x=b$ . We know that area of trapezium = height  $\times$  (average of parallel lines)

$$\text{Area} = \frac{1}{2} \times h \times (a+b)$$

→ So if we join the ~~non~~ points  $(a, f(a))$  and  $(b, f(b))$ , it forms a trapezium, with parallel side length as  $f(a)$  and  $f(b)$ . Height of trapezium is  $(b-a)$ , hence from the following graph, area of trapezium is  $\frac{b-a}{2} [f(a) + f(b)] = \frac{\Delta x}{x} [f(a) + f(b)]$

Q5 Explain basic principle (no derivation) in deriving Newton Cote's integration formula.

Ans

The basic principle in obtaining Newton Cote's integration formula is to fix abscissas  $x_0, x_1, x_2, \dots, x_n$  in  $[a, b]$  beforehand and integral  $f(x)$  is approximated by interpolating polynomial  $P_n(x)$ , ( $P_n(x_i) = y_i$ ,  $i = 1, 2, \dots, n$ ). Integral of  $P_n(x)$  is taken as approximate value of  $I(f)$ . Formula we derive, is of the form  $\sum_{i=0}^n l_i f(x_i)$ .

- Interpolating polynomial  $P_n(x)$  is given by.

$$P_n(x) = \sum_{i=0}^n l_i(x) y_i, \quad (y_i = f(x_i))$$

$$\text{where, } l_i(x) = \prod_{j=0, j \neq i}^n \frac{(x - x_j)}{x_i - x_j}$$

$$\forall i = 0, 1, \dots, n.$$

Thus,

$$a \int_a^b f_h(x) dx = \int_a^b \left( \sum_{i=0}^n w_i i(x) y_i \right) dx$$

$$= \sum_{i=0}^n \left( a \int_a^b d_i(x) dx \right) y_i$$

$$= \sum_{i=0}^n w_i y_i$$

$$\text{giving } w_i = a \int_a^b d_i(x) dx$$

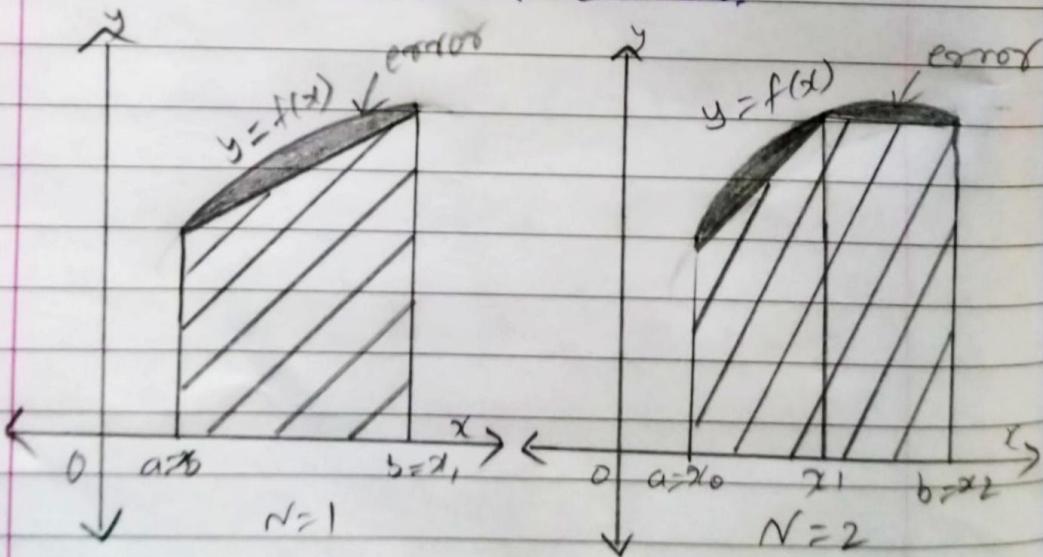

Q6. Write the composite form of trapezoidal rule for  $\int_a^b f(x) dx$ .

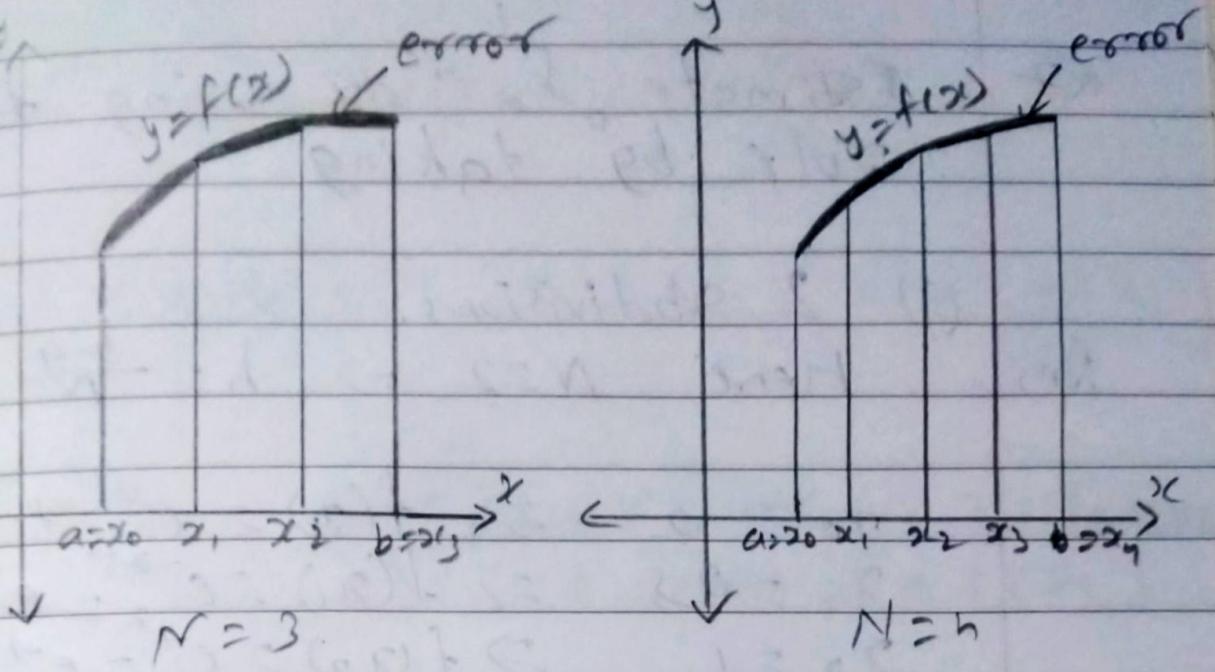

Anc.

If  $[a, b]$  is divided into  $N$  equal subdivisions, the composite form of trapezoidal rule for  $\int_a^b f(x) dx$  is,

$$\int_a^b f(x) dx \approx \frac{h}{2} [f(x_0) + 2 \sum_{i=1}^{N-1} f(x_i) + f(x_N)]$$

→ The following figures shows as number of segments or intervals are increasing, i.e. use of composite form reduces ~~factors~~ error truncation error.

a7 Estimate  $\int_0^1 e^{-x^2} dx$  using trapezoidal rule by taking

(i) 2 subdivisions.

Ans Here  $N=2 \Rightarrow h = \frac{b-a}{N} = \frac{1-0}{2} = 0.5$

$$x_0 = 0 \Rightarrow f(x_0) = e^0 = 1$$

$$x_1 = 0.5 \Rightarrow f(x_1) = e^{-0.5^2} = e^{-0.25} = 0.7788$$

$$x_2 = 1 \Rightarrow f(x_2) = e^{-1^2} = e^{-1} = 0.3679$$

$$\int_0^1 e^{-x^2} dx = \int_0^1 f(x) dx \approx \frac{h}{2} [f(x_0) + 2f(x_1) + f(x_2)]$$

$$= \frac{0.5}{2} [1 + 2(0.7788) + 0.3679]$$

$$= 0.25 [2.9255] = 0.7313$$

$$\int_0^1 e^{-x^2} dx = 0.7313$$

(ii) 4 subdivisions:

$$\therefore N=4 \Rightarrow h = \frac{1}{4} = 0.25$$

$$x_0 = 0 \Rightarrow f(x_0) = e^0 = 1$$

$$x_1 = 0.25 \Rightarrow f(x_1) = e^{-0.25^2} = 0.9394$$

$$x_2 = 0.50 \Rightarrow f(x_2) = e^{-0.50^2} = 0.7788$$

$$x_3 = 0.75 \Rightarrow f(x_3) = e^{-0.75^2} = 0.5698$$

$$x_0 = 0 \quad \Rightarrow f(x_0) = e^{-0^2} = 1$$

$$\int_0^1 f(x) dx \approx \frac{h}{2} [f(x_0) + 2 \sum_{i=1}^3 f(x_i) + f(x_4)]$$

$$\int_0^1 e^{-x^2} dx \approx \frac{0.25}{2} [1 + 2(0.9394 + 0.7788) + 0.5698 + 0.3679]$$

$$= 0.7430$$

(iii) 6 subdivision.

$$\text{Here } N=6, h = \frac{1-0}{6} = 0.1667$$

$$x_0 = 0 \Rightarrow f(x_0) = 1$$

$$x_1 = 0.1667 \Rightarrow f(x_1) = 0.9726$$

$$x_2 = 0.3334 \Rightarrow f(x_2) = 0.8948$$

$$x_3 = 0.5001 \Rightarrow f(x_3) = 0.7788$$

$$x_4 = 0.6668 \Rightarrow f(x_4) = 0.6412$$

$$x_5 = 0.8335 \Rightarrow f(x_5) = 0.4994$$

$$x_6 = 1 \Rightarrow f(x_6) = 0.3679$$

$$\int_0^1 f(x) dx \approx \frac{h}{2} [f(x_0) + 2 \sum_{i=1}^5 f(x_i) + f(x_6)]$$

$$= \frac{0.1667}{2} [1 + 2(0.9726 + 0.8948 + 0.7788 + 0.6412 + 0.4994) + 0.3679]$$

$$= 0.7452,$$

Q8

calculate approximate integral  
value of  $\int f(x) dx$  when  $f(x)$  is  
@  $x^2$  using (i) Trapezoidal rule.

Ans

$$\int_a^b f(x) dx = \frac{h}{2} [f(a) + f(b)]$$

Here  $n=1$

$$L = \frac{b-a}{n}$$
$$= \frac{2-0}{1}$$

$$= 2$$

$$\therefore \int_0^2 x^2 dx = \frac{2}{2} [f(0) + f(2)]$$

$$= 1 \cdot \cancel{[0]} \cancel{[4]} = [1 + 2 \cdot 4]$$

$$= 10.236$$

(ii) Simpson's  $\frac{1}{3}$  rule.

$$\rightarrow \int_a^b f(x) dx = \frac{h}{3} [f(a) + 4f(a+h) + f(a+2h)]$$

Here  $n=2$

$$h = \frac{b-a}{n}$$

$$= \frac{2-0}{2}$$

$$= 1$$

$$\int_0^2 x^2 dx = \frac{1}{3} [f(0) + 4(f(0+1)) + f(0+2)]$$

$$= \frac{1}{3} [1 + 4(1.6142) + 2.8333]$$

$$= \frac{1}{3} [8.8929]$$

$$= 2.9643$$

⑥  $x^n$

(i) Trapezoidal Rule

$$\int_a^b f(x) dx = \frac{h}{2} [f(a) + f(b)]$$

$$\text{Here } n=1, h = \frac{2}{1} = 2$$

$$\int_0^2 x^4 dx = \frac{2}{2} [f(0) + f(2)] \\ = 1 [0 + 10]$$

= 16

(ii) Simpson's  $\frac{1}{3}$  rule.  $n=2, h=1$

$$\int_0^2 x^4 dx = \frac{1}{3} [f(0) + 4f(1) + f(2)] \\ = 6.6667$$

(iii) Simpson's  $\frac{3}{8}$  rule.

$$\int_0^2 f(x) dx = \frac{1}{4} [f(0) + 3f(\frac{2}{3}) + 3f(2\frac{2}{3}) + f(3\frac{2}{3})]$$

$$= \frac{1}{4} [0 + 3 \times \frac{16}{81} + 3 \times \frac{236}{81} + 128]$$

$$= \frac{1}{4} [\frac{16}{81} + \frac{236}{81} + 10]$$

$$= \frac{16}{81} [\frac{1}{27} + \frac{16}{27} + 1]$$

$$= 4 [\frac{49}{27}]$$

$$= 6.5185$$

$$\textcircled{1} \quad I(x+1)$$

i) Trapezoidal,  $n=1, h=2$

$$\int_0^2 1/(x+1) dx = \frac{2}{2} [f(0) + f(2)] \\ = 1 [1 + 0.333] \\ = 1.333$$

ii) Simpson's  $\frac{1}{3}$  rule  $n=2, h=1$

$$\int_0^2 1/(x+1) dx = \frac{1}{3} [f(0) + 4f(0.5) + f(1)] \\ = \frac{1}{3} [1 + 4 \times \frac{1}{2} + 0.333] \\ = \frac{1}{3} [3.333]$$

$$= 1.111$$

iii) Simpson's  $\frac{3}{8}$  rule.  $n=3, h=\frac{2}{3}$

$$\int_0^2 1/(x+1) dx = \frac{3h}{8} \left[ f(0) + 3f(0+\frac{h}{3}) + 3f(0+2 \cdot \frac{h}{3}) + f(0+3 \cdot \frac{h}{3}) \right] \\ = \frac{1}{3} [1 + 3 \times (\frac{3}{8}) + 3 \times (\frac{3}{2}) + \frac{1}{3}] \\ = \frac{1}{3} [1 + 1.8 + 1.2858 + 0.3333] \\ = 1.1048$$

$$\textcircled{d} \quad \int \sqrt{1+x^2} dx$$

\( \textcircled{d} \) Trapezoidal rule \( n=1, h=2 \)

$$\int_0^2 \sqrt{1+x^2} dx = \frac{h}{2} [f(0) + f(2)]$$

$$= \frac{2}{2} [0 + 2.2361]$$

$$= 2.2361$$

(ii) Simpson's rule \( n=2, h=1 \)

$$\int_0^2 \sqrt{1+x^2} dx = \frac{h}{3} [f(0) + 4f(1) + f(2)]$$

$$= \frac{1}{3} [0 + 4 \times 1.4142 + 2.2361]$$

$$= \frac{1}{3} [7.8929]$$

$$= 2.63097$$

(iii) Simpson's  $\frac{3}{8}$  rule \( n=3, h=\frac{2}{3} \)

$$\int_0^2 \sqrt{1+x^2} dx = \frac{3h}{8} [f(0) + 3f(0+\frac{2}{3}) + 3f(0+2(\frac{2}{3})) + f(0+3(\frac{2}{3}))]$$

$$= \frac{1}{6} [0 + 3 \times 1.2019 + 3 \times 6.6667 + 2.2363]$$

$$= \frac{1}{4} [10.8419]$$

$$= 2.7105$$

Q)  $\int_0^2 \sin x dx$

(i) Trapezoidal n=1, h=2

$$\int_0^2 \sin x dx = \frac{h}{2} [f(0) + f(2)]$$

$$\int_0^2 \sin x dx = 1 [0 + 0.9093]$$

$$= 0.9093$$

(ii) Simpson's  $\frac{1}{3}$  rule. n=2 h=1

$$\int_0^2 \sin x dx = \frac{h}{3} \left\{ f(0) + 4f(0.5) + f(1) \right\}$$

$$= \frac{1}{3} [0 + 4 \times 0.8415 + 0.9093]$$

$$= \frac{1}{3} [4.2752]$$

$$= 1.425$$

(iii) Simpson's  $\frac{3}{8}$  rule. n=3 h=  $\frac{2}{3}$

$$\int_0^2 \sin x \, dx:$$

$$= \frac{3h}{8} \left[ f(0) + 3\left(f\left(0+\frac{2}{3}\right)\right) + 3f\left(0+2\left(\frac{2}{3}\right)\right) + f\left(0+3\left(\frac{2}{3}\right)\right) \right]$$

$$= \frac{1}{4} [0 + 3(0.6184) + 3(0.9720) + 0.9043]$$

$$= \frac{1}{4} [5.6805]$$

$$= 1.4201$$

$$\textcircled{B} e^x$$

(i) Trapezoidal rule.

$$\int_0^2 e^x \, dx = \frac{h}{2} [f(0) + f(2)]$$

$$= 1 [1 + 7.3891]$$

$$= 8.3891$$

(ii) Simpson's  $\frac{3}{8}$  rule  $n=2$   $L=\frac{2}{3}$

$$\int_0^2 e^x dx = \frac{3h}{8} \left[ f(0) + 3f\left(0+\frac{L}{3}\right) + 3f\left(0+2\left(\frac{2}{3}\right)\right) + f\left(0+3\left(\frac{2}{3}\right)\right) \right]$$

$$= \frac{1}{4} [1 + 3(1.9477) + 3(3.7937) + 7.3891]$$

$$= \frac{1}{4} (25.6133)$$

$$\boxed{= 6.4033}, //$$

(ii) Simpson's rule  $n=2$   $L=1$

$$\int_0^2 e^x dx = \frac{h}{3} \left[ f(0) + 4f(0+1) + f(0+2) \right]$$

$$= \frac{1}{3} [1 + 4(2.7183) + 7.3891]$$

$$= \frac{1}{3} (19.2623)$$

$$\boxed{= 6.408}, //$$

Q9. Given function  $f$  at the following values.

$x$	1.8	2.0	2.2	2.4	2.6
$f(x)$	3.12014	4.42569	6.04241	8.03014	10.4607

Approximate  $\int_{1.8}^{2.6} f(x) dx$  using

- (a) Trapezoidal Rule      (b) Simpson's  $\frac{1}{3}$  Rule

Ans       $N = 4, h = \frac{2.6 - 1.8}{4} = 0.2$

(a) Trapezoidal Rule

$$\int_a^b f(x) dx = \frac{h}{2} [f(x_0) + 2 \sum_{i=1}^{N-1} f(x_i) + f(x_N)]$$

$$\int_{1.8}^{2.6} f(x) dx = \frac{0.2}{2} [3.12014 + 2(4.42569 + 6.04241 + 8.03014) + 10.46075]$$

$$= 0.1 [50.58337]$$

$$= 5.05834$$

6) Simpson's  $\frac{1}{3}$  rule.

$$1.8 \int_{1.8}^{2.6} f(x) dx = \frac{0.2}{3} [3.12014 + 4(6.44241) + 10.48675]$$

$$= 0.06667 [81.53744]$$

$$1.8 \int_{1.8}^{2.6} f(x) dx = 5.4361$$

Q10 Given the form of closed type Newton Cote's integration formula as

$$\int_a^b f(x) dx \approx nh \sum_{i=0}^n c_i f(x_i) \text{ with}$$

$$L = \frac{b-a}{n}, x_i = x_0 + ih, i=0, 1, 2, \dots, n$$

State two properties of Newton Cote's coefficient  $c_i^n$ .

Ans.  $c_i^n$  have two important properties.

$$\textcircled{1} \quad \sum_{i=0}^n c_i^n = 1$$

$$\textcircled{2} \quad c_i^n = c_{n-i}^n$$

Q11

Derive.

Ans. @ Trapezoidal Rule

We have the closed type  
Newton Cote's integration formula

$$\int_a^b f(x) dx \approx nh \sum_{i=0}^n c_i^n f(x_i)$$

with  $h = \frac{b-a}{n}$ ,  $x_i = x_0 + ih$ ,

$$i = 0, 1, 2, \dots, n$$

Let  $n=1$ 

$$\begin{aligned} \int_a^b f(x) dx &= 1h \sum_{i=0}^1 c_i^n f(x_i) \\ &= h c'_0 f(x_0) + h c'_1 f(x_1) \end{aligned}$$

By two properties of Newton Cote's coefficients.

$$c'_0 = c'_1 \text{ and } c'_0 + c'_1 = 1 \text{ gives}$$

$$c'_0 = c'_1 = \frac{1}{2}$$

$$\Rightarrow \int_a^b f(x) dx = \frac{h}{2} [f(x_0) + f(x_1)], \text{ which}$$

is trapezoidal formula.

⑥ Simpson's  $\frac{1}{3}$  Rule

$$\int_a^b f(x) dx \approx nh \sum_{i=0}^n c_i^h f(x_i)$$

$$\text{with } h = \frac{b-a}{2},$$

$$x_i = x_0 + ih,$$

$$i = 0, 1, 2, \dots, n$$

let  $n=2$

$$\int_a^b f(x) dx \approx 2h \sum_{i=0}^2 c_i^2 f(x_i) \quad ①$$

$$\text{Here } c_0^2 = c_2^2 \text{ and } c_0^2 + c_1^2 + c_2^2 = 1$$

By evaluating  $c_1^2$

$$\text{we know that } c_1^h = \frac{(1)^{h-i}}{ni!(n-i)!}$$

$$\int_0^n \frac{t(t-1)(t-n)}{(t-i)} dt$$

$$c_2^2 = \frac{(-1)^{2-2}}{22!(2-2)!} \int_0^2 \frac{t(t-1)(t-2)}{(t-2)} dt$$

$$c_2^2 = \cancel{\textcircled{1}} \frac{1}{n} \int_0^2 t(t-1) dt$$

$$= \frac{1}{n} \int_0^2 (t^2 - t) dt$$

$$= \frac{1}{n} \left[ \frac{t^3}{3} - \frac{t^2}{2} \right]_0^2$$

$$= \frac{1}{n} \left[ \frac{8}{3} - 2 \right]$$

$$= \frac{1}{n} \left[ \frac{2}{3} - 2 \right]$$

$$= \frac{1}{n} \left[ \frac{2-6}{3} \right]$$

$$= \frac{1}{n} \left[ \frac{2}{3} \right]$$

$$= \frac{1}{6}$$

$$\therefore c_2^2 = \frac{1}{6} \Rightarrow c_0^2 = c_2^2 = \frac{1}{8}$$

$$\text{and } c_1^2 = 1 - (c_0^2 + c_2^2) \\ = 1 - \frac{2}{6} = \frac{1}{3}$$

$$\therefore ① \Rightarrow \int_a^b f(x) dx \approx 2h [c_0^2 f(x_0)$$

$$+ 2h c_1^2 f(x_1) + 2h c_2^2 f(x_2)]$$

$$\approx \frac{h}{3} f(x_0) + \frac{4h}{3} f(x_1) + \frac{h}{3} f(x_2)$$

$$\Rightarrow \int_a^b f(x) dx \approx \frac{h}{3} [f(x_0) + 4f(x_1) + f(x_2)]$$

which can also be expressed as

$$\int_a^b f(x) dx = \frac{b-a}{6} [f(a) + 4f\left(\frac{a+b}{2}\right) + f(b)]$$

$\Delta x$

$$\int_a^b f(x) dx \approx \frac{h}{3} [f(a) + 4f(a+h) + f(a+2h)]$$

This is Simpson's  $\frac{1}{3}$  Rule

Q12

Estimate  $\int_0^4 e^x dx$

Ans

(a) Simpson's  $\frac{1}{3}$  rule

$$\int_a^b f(x) dx = \frac{h}{3} [f(a) + 4f(a+h) + f(a+2h)]$$

here  $n=2, h=2$

$$\begin{aligned}\int_0^4 e^x dx &= \frac{2}{3} [f(0) + 4f(0+1) + f(0+2)] \\ &= \frac{2}{3} [1 + 4(7.38900) + 54.59815] \\ &= \frac{2}{3} [85.15439] \\ &= 56.769593\end{aligned}$$

(b) Composite Simpson's  $\frac{1}{3}$  rule  
with  $N=2$

Ans

here  $N=2, h=2$

$$x_0 = 0 \quad = 1$$

$$x_1 = 2 \quad = 7.38906$$

$$x_2 = 4 \quad = 54.59815$$

$$\int_0^4 e^x dx = \frac{h}{3} [f(x_0) + 2(f(x_1)) + f(x_2)]$$

$$= \frac{2}{3} [1 + 2(7.38906) + 54.59815]$$

$$= \frac{2}{3} [85.15439]$$

$$= 56.769593$$

Q Calculate error in above

Error in Q Simpson's  $\frac{1}{3}$  Rule

Error = True value - Approximate value

$$= 53.59815 - 56.769593$$

$$= -3.171443$$

error in ⑥ composite Simpson's  
Rule with  $N=2$

$$\therefore \text{error} = 53.59815 - 96.76953 \\ = -43.171443 //$$

error in ⑦ composite Simpson's rule  
with  $N=4$

$$\text{error} = 53.59815 - 53.86385 \\ = -0.2657 //$$

Q13 Write pseudocode for following integration formula to obtain results to desired accuracy

Q) Simpson's  $\frac{1}{3}$  Rule

Ans Pseudocode for Simpson's  $\frac{1}{3}$  Rule.

Step 1:  $a, b, f(x), n = \max \text{ no of iterations}$  as inputs.

Step 2:  $h = (b-a)/(2+n)$

Step 3: Do

for  $i=1$  to  $n-1$

$x(2*i) = a + h * 2*i;$

$x(2*i+1) = a + h * (2*i+1)$

sum = sum +  $f(x(2*i))$

End do.

Step 4: sum =  $2 * \sum f(x_k) + \sum f(a) + f(b)$

Step 5: Output:  $Sum = h * sum / 3$   
Print sum

Step 6 : If  $|sum - old\ sum| < \epsilon$ ;  
Output : Ans = sum;  
Exit  
Else

Step 7 :  $k = k+1$ ,  $n = 2 * n$ ;  
 $old\ sum = sum$ ;  
if  $k \leq m$ , goto step 3

Step 8 : Else:

Print does not give desired  
accuracy in  $n$  iteration.

## ⑥ Trapezoidal Rule

~~Step 1 : Input N, a, b, f(x),  
exit~~

Step 1 : Input  $n, a, b, f(x)$ ,  
 $M = \text{max iteration}$ .

Step 2 :  $sum = 0$ ;  $k = 0$ ;  
 $n = 1$ ;  $old\ sum = 0$ ;  
 $h = (b-a)/n$ ;

Step 3:

Do

for  $i=1$  to  $n-1$

$x = a + h * i$

$\text{sum} + f(x)$

end do

Step 4:  $\text{sum} + f(a) + f(b)$

Step 5:  $\text{sum} = (h/2) * \text{sum};$   
print sum.

Step 6: If  $| \text{sum} - \text{oldsum} | < \epsilon$   
output: The estimated  
the integral is sum;  
Exit;

Step 7: Else

$k = k+1; n = 2 * n;$

$\text{oldsum} = \text{sum};$

if  $k \leq m$  goto Step 3

Step 8: Else

Print does not give  
desired accuracy in ' $n$ ' iteration

Q14

Time	0	6	12	18	24	30	36	42	48
Speed	124	134	148	156	147	133	121	109	99

Time	36	60	66	72	78	89
Speed	85	78	89	101	116	123

how long is the track

$$\int_0^{84} f(x) dx$$

∴ By Simpson's  $\frac{1}{3}$  formula

$$\text{here } N=14 \quad h = \frac{84}{14} = 6$$

$$\therefore \int_0^{84} f(x) dx =$$

$$\frac{h}{3} [f(x_0) + h[f(x_1) + f(x_3) + f(x_5) + f(x_7) + f(x_9) + f(x_{11}) + f(x_{13})] + 2[f(x_2) + f(x_4) + f(x_6) + f(x_8) + f(x_{10}) + f(x_{12})] + f(x_{14})]$$

$$= \frac{6}{3} [124 + 6[134 + 156 + 133 + 109 + 85 + 89 + 116] + 2[148 + 147 + 121 + 96 + 104] + 123]$$

$$= 2 [4929] = 9858 \text{ feet}$$

Q15

Approximate  $\int_0^2 x^2 \ln(x^2 + 1) dx$   
 Using  $h = 0.25$  use

① composite trapezoidal rule

Ans Here  $h = 0.25$ ,  $N = \frac{b-a}{h} = \frac{2-0}{0.25} = 8$

$$\int_0^2 x^2 \ln(x^2 + 1) dx = \frac{h}{2} [f(x_0) + 2[f(x_1) + f(x_2) + f(x_3) + f(x_4) + f(x_5) + f(x_6) + f(x_7)] + f(x_8)]$$

Here

$$x_0 = 0 \Rightarrow f(x_0) = 0$$

$$x_1 = 0.25 \Rightarrow f(x_1) = 0.00379$$

$$x_2 = 0.50 \Rightarrow f(x_2) = 0.05579$$

$$x_3 = 0.75 \Rightarrow f(x_3) = 0.25104$$

$$x_4 = 1 \Rightarrow f(x_4) = 0.6931$$

$$x_5 = 1.25 \Rightarrow f(x_5) = 1.47029$$

$$x_6 = 1.50 \Rightarrow f(x_6) = 2.65192$$

$$x_7 = 1.75 \Rightarrow f(x_7) = 4.29301$$

$$x_8 = 2 \Rightarrow f(x_8) = 6.43775$$

$$\int_0^2 x^2 \ln(x^2 + 1) dx$$

$$= \frac{0.25}{2} [0 + 2[0.00379 + 0.0557 \\ + 0.25104 + 0.69315 + \\ 1.47029 + 2.65197 + \\ 4.29301] + 6.43775]$$

$$= 0.125 [25.27583]$$

$$= 3.1595$$

② Composite Simpson's rule

here  $L = 0.25$ ,  $n = 2$

$$= \frac{0.25}{3} [0 + 4(0.00379 + 0.25104) \\ + 2(0.47029 + 0.29301) + 2(0.0557 \\ + 0.69315 + 2.65197) + 6.43775]$$

$$= 0.083334 [32.31209]$$

$$= 3.15921$$

### ③ Composite Midpoint Rule.

$$\text{midPoint} = \int_a^b f(x) dx = (b-a) \frac{f(\bar{x}_{\text{mid}})}{2}$$

$$\therefore \int_0^2 x^2 \ln(x^2+1) dx = \int_0^{0.25} x^2 \ln(x^2+1) dx + \dots + \int_{0.75}^{0.50} x^2 \ln(x^2+1) dx + \dots +$$

$$\int_{0.75}^{2} x^2 \ln(x^2+1) dx$$

$$\therefore \int_0^{2.25} x^2 \ln(x^2+1) dx = (0.25-0) \frac{f(0.25+0)}{2}$$

$$= 0.25 (f(0.125))$$

$$= 0.25 (0.00025)$$

$$= 0.00006,$$

$$\therefore \int_{0.25}^{0.50} x^2 \ln(x^2+1) dx = 0.25 f(0.375)$$

$$= 0.25 (0.0185)$$

$$= 0.00463,$$

$$\int_{0.50}^{0.75} x^2 \ln(x^2 + 1) dx = 0.25 \times f(0.625)$$
$$= 0.25 (0.12881)$$
$$= 0.03220$$

$$\int_{0.75}^1 x^2 \ln(x^2 + 1) dx = 0.25 \times f(0.875)$$
$$= 0.25 (0.43526)$$
$$= 0.10882$$

$$\int_1^{1.25} x^2 \ln(x^2 + 1) dx = 0.25 \times f(1.125)$$
$$= 0.25 \times 1.03504$$
$$= 0.25872$$

$$\int_{1.25}^{1.50} x^2 \ln(x^2 + 1) dx = 0.25 \times f(1.375)$$
$$= 0.25 (2.00685)$$
$$= 0.50171$$

$$\int_{1.50}^{1.75} x^2 \ln(x^2 + 1) dx = 0.25 (f(1.625))$$
$$= 0.25 (3.41210)$$
$$= 0.85302$$

$$\int_{-0.75}^2 x^2 \ln(x^2 + 1) dx = 0.25 \times 0.2 f(1.87)$$
$$= 0.25 (5.29996)$$
$$= 1.32499$$

$$\int_0^2 x^2 \ln(x^2 + 1) dx = 0.00006 + 0.00483$$
$$+ 0.03220 f 0.10822$$
$$+ 0.25877 + 0.50171$$
$$+ 0.85302 + 1.32499$$
$$\int_0^2 x^2 \ln(x^2 + 1) dx = 3.0842$$

Q16 Approximate  $\int_0^2 x^2 e^{-x^2} dx$  using

$$h = 0.25$$

@ Composite trapezoidal rule.

Ans

$$h = 0.25, N=8$$

$x_0 = 0$	$= 0$
$x_1 = 0.25$	$= 0.05871$
$x_2 = 0.50$	$= 0.1947$
$x_3 = 0.75$	$= 0.3205$
$x_4 = 1$	$= 0.36788$
$x_5 = 1.25$	$= 0.3275$
$x_6 = 1.50$	$= 0.23715$
$x_7 = 1.75$	$= 0.14324$
$x_8 = 2$	$= 0.07326$

$$= \frac{0.2}{2} [0 + 2(0.05871 + 0.1947 + 0.3205 + 0.36788 + 0.3275 + 0.23715 + 0.14324 + 0.07326)]$$

$$= 0.42158$$

⑥ Composite Simpson  $\frac{1}{3}$  rule

$$h = 0.25, N=8$$

$$\int_0^2 x^2 e^{-x^2} dx = \boxed{0.42102}$$

$$= \frac{0.25}{3} [0 + h(0.05871 + 0.3205) +$$

$$2(0.1947 + 0.3678) + 0.23715 + 0.07328]$$

$$= 0.083 [5.07252]$$

$$\boxed{= 0.42102}$$

⑦ Composite midpoint rule.

$$\int_0^{0.25} x^2 e^{-x^2} dx = 0.25 \times f(0.125)$$

$$= 0.25 \times 0.01538$$

$$= 0.00385.$$

Like that

$$\int_{0.25}^{0.50} x^2 e^{-x^2} dx = 0.03054$$

$$\int_{0.50}^{0.75} x^2 e^{-x^2} dx = 0.06608$$

$$\int_{0.75}^1 x^2 e^{-x^2} dx = 0.08901$$

$$\int_1^{1.25} x^2 e^{-x^2} dx = 0.08925$$

$$\int_{1.25}^{1.50} x^2 e^{-x^2} dx = 0.07136$$

$$\int_{1.50}^{1.75} x^2 e^{-x^2} dx = 0.04708$$

$$\int_{1.75}^2 x^2 e^{-x^2} dx = 0.02613$$

$$\begin{aligned} \int x^2 e^{-x^2} dx &= 0.00325 + 0.03054 \\ &+ 0.06608 + 0.08901 + 0.08925 \\ &+ 0.07136 + 0.04708 + 0.02613 \end{aligned}$$

$$\therefore \int_0^2 x^2 e^{-x^2} dx = \boxed{0.4233}$$

YOUNV

Q1 Write Gauss Legendre Quadrature formula for estimating  $\int_{-1}^1 f(x) dx$  for  $n = 1, 2$  and  $3$  ( $n = \text{number of abscissas}$ )

Ans Gauss Legendre, quadrature formula for estimating  $\int_{-1}^1 f(x) dx$

for  $n=1$  is

$$\int_{-1}^1 f(x) dx \approx 2f(0)$$

for  $n=2$

$$\int_{-1}^1 f(x) dx \approx f\left(\frac{-1}{\sqrt{3}}\right) + f\left(\frac{1}{\sqrt{3}}\right)$$

for  $n=3$

$$\int_{-1}^1 f(x) dx \approx \frac{5}{9} f\left(-\sqrt{\frac{3}{5}}\right) + \frac{8}{9} f(0)$$

$$+ \frac{5}{9} f\left(\sqrt{\frac{3}{5}}\right)$$

Q2 Approximate  $\int_{-1}^1 e^x \cos x dx$  using Gauss Legendre quadrature formula

(i) taking  $n=2$

Ans The Gauss Legendre quadrature formula for  $\int_{-1}^1 f(x) dx$  for  $n=2$  is

$$\int_{-1}^1 f(x) dx \approx f\left(-\frac{1}{\sqrt{3}}\right) + f\left(\frac{1}{\sqrt{3}}\right)$$

$$\int_{-1}^1 e^x \cos x dx \approx e^{\frac{1}{\sqrt{3}}} \cos\left(-\frac{1}{\sqrt{3}}\right) +$$

$$e^{\frac{1}{\sqrt{3}}} \cos\left(\frac{1}{\sqrt{3}}\right)$$

$$= 1.96297$$

(ii) for  $n=3$

$$\int_{-1}^1 f(x) dx \approx \frac{5}{9} f\left(-\frac{\sqrt{3}}{5}\right) + \frac{8}{9} f(0) + \frac{5}{9} f\left(\frac{\sqrt{3}}{5}\right)$$

$$\int_{-1}^1 e^x \cos x dx = \frac{5}{9} \times e^{-\sqrt{\frac{3}{5}}} \cos\left(-\sqrt{\frac{3}{5}}\right) +$$

$$\frac{8}{9} e^0 \cos 0 + \frac{5}{9} e^{\sqrt{\frac{3}{5}}} \times \cos\left(\sqrt{\frac{3}{5}}\right)$$

$$= 1.93339$$

Q3 Show how an integral  $\int_a^b f(x) dx$  over an arbitrary  $[a, b]$  can be transformed into integral over  $[-1, 1]$ .

Ans To transform  $\int_a^b f(x) dx$  to  $\int_{-1}^1 g(t) dt$  we use a change of variables from  $x$  to  $t$  define by  $x = \frac{b-a}{2}t + \frac{a+b}{2}$

$$\frac{b-a}{2}$$

- on putting  $x=a$  and solving for  $t$  we obtain,  $a = \frac{b-a}{2}$

$$t + \frac{b-a}{2}$$

which on Solving gives value of  $t$  as  $-1$ . similarly putting  $x=b$ , we obtain,  $b = \frac{b-a}{2}t + \frac{a+b}{2}$

$$\frac{b-a}{2} t + \frac{a+b}{2}$$

$t=1$ . Thus limits of integration

change from  $a$  to  $b$  into  $-1$  to  $1$  now also  $dx = \frac{b-a}{2} dt$

$$\int_a^b f(x) dx = \frac{b-a}{2} \int_{-1}^1 f\left(\frac{b-a}{2}t + \frac{b+a}{2}\right) dt$$

~~in start changing limit~~

~~in end changing limit~~

Qn Write open Newton Cotes integral formulas for

(a)  $n = 0$  (midpoint rule)

(b)  $n \geq 1$

And show midpoint rule is same as Gauss quadrature one point formula

Ans open Newton Cotes integral formula for

(a)  $n = 0$

midpoint rule,  $n = 0, h = \frac{b-a}{2}$

if  $a = x - 1, b = x$

$$\int_{x-1}^{x_1} f(x) dx = 2h f(x_0) + \frac{1}{3} h^3 f''(x)$$

Here last term is error term.

$$(b) n=1 ; h = \frac{(b-a)}{3}$$

$$a = x_0 - 1, b = x_2$$

$$\int_{x_0-1}^{x_2} f(x) dx = \frac{3h}{2} [f(x_0) + f(x_1)] + \frac{3h^3}{4} f''(c)$$

Hence last term is error term

$\Rightarrow$  The Gauss quadrature one point formula is  $\int_a^b f(x) dx = v_1 f(x_1)$

$\therefore$  It gives exact result, when  $f(x)$  of degree  $\leq n-1$

Now let  $f(x) = 1$  &  $f'(x) = x$   
one by one

$$\text{for } f(x) = 1, \int_a^b dx = b-a$$

$$\therefore v_1 = b-a = 1 \quad (1)$$

$$\text{for } f(x) = x, \int_a^b x dx = v_1 x_1$$

$$\Rightarrow \left[ \frac{x^2}{2} \right]_a^b = V_1 x_1$$

$$\Rightarrow V_1 x_1 = \frac{1}{2} (b^2 - a^2) \quad \textcircled{2}$$

putting \textcircled{1} in \textcircled{2},  $x_1 = \frac{1}{2} (b+a)$

\therefore The resulting Gaussian quadrature formula is

$$\int_a^b f(x) dx \approx (b-a) f\left(\frac{a+b}{2}\right)$$

which is same as midpoint rule.

Q5 Consider  $\int_1^3 (x^6 - x^2 \sin 2x) dx$ .

Exact value is 312.3442466

Estimate value of integral using

① simple trapezoidal rule.

Ans.

$$\text{Let } f(x) = (x^6 - x^2 \sin 2x) dx$$

$$n = 1, h = \frac{3-1}{2} = 2$$

$$\int_1^3 f(x) dx = \frac{h}{2} [f(3) + f(1)]$$

$$= \frac{2}{2} [731.5147 + 0.0907]$$

$$\int_1^3 f(x) dx = 731.6054$$

② open Newton-Cotes formula  
for  $n=2, h=1$

$$\text{for } n=2, h = \frac{3-1}{2} = \frac{2}{2} = 1$$

$$f(x) = (x^6 - x^2 \sin 2x)$$

$$\therefore \int_1^3 f(x) dx = 2h \left( f\left(\frac{3+1}{2}\right) \right)$$

$$= 2f(2)$$

$$= 2(67.0272)$$

$$\text{Actual value} = 135.0564$$

$$\text{for } n=1, h = \frac{b-a}{3} = \frac{2}{3}$$

$$\int_1^3 f(x) dx = \frac{3h}{2} \left[ f\left(1 + \frac{2}{3}\right) + f\left(1 + 2\left(\frac{2}{3}\right)\right) \right]$$

$$= 1 \left[ f\left(\frac{5}{3}\right) + f\left(\frac{7}{3}\right) \right]$$

$$= 1 [21.9623 + 166.8228]$$

$$\text{Actual value} = 188.7856$$

① Simpson's  $\frac{1}{3}$  rule.

$$\text{Ans} \quad \int_1^3 f(x) dx = \frac{h}{3} [f(a) + 4f(a+h) + f(a+2h)]$$

$$\text{Here } f(x) = (x^6 - x^2) \sin 2x$$

$$n = 2, L = \frac{3-1}{n} = \frac{2}{2} = 1$$

$$\int_1^3 f(x) dx = \frac{1}{3} [f(1) + 4f(2) + f(3)]$$

$$= \frac{1}{3} [0.0907 + 4(67.0271) + 731.3142]$$

$$= \frac{1}{3} [999.7142]$$

$$\int_1^3 f(x) dx = 333.2381$$

Q) Gauss Quadrature two point formula.

We know that the formula is

$$\int_{-1}^1 f(x) dx = f\left(-\frac{1}{\sqrt{3}}\right) + f\left(\frac{1}{\sqrt{3}}\right)$$

Our integral is,  $\int_{-1}^3 (x^6 - x^2 \sin 2x) dx$

- We shall need to transform the given interval to.

$\int_{-1}^3 g(t) dt$  through below

equation,

$$\int_a^b f(x) dx = (b-a) \int_{-1}^1 f\left(\frac{b-a}{2}t + \frac{a+b}{2}\right) dt$$

$$\left(\frac{b-a}{2}\right) dt$$

$\Rightarrow$  Here  $a=1$ ,  $b=3$ ,  $f(x)=x^6 - x^2 \sin 2x$

Substitute  $x = \frac{3-1}{2}t + \frac{1+3}{2}$

$$\Rightarrow x = t + 2$$

$$\therefore \int_1^3 f(x) dx = \left(\frac{3-1}{2}\right) \int_{-1}^1 f(t+2) dt \quad \text{--- (1)}$$

$$= 1 \times \int_{-1}^1 [(t+2)^6 - (t+2)^2 \sin 2 \\ (t+2) dt.$$

(e.g)

$$(1) \Rightarrow \int_1^3 f(x) dx =$$

$$1 \times [(-\frac{1}{\sqrt{3}} + 2)^6 - (-\frac{1}{\sqrt{3}} + 2)^2 \sin 2(2 + (-\frac{1}{\sqrt{3}})) \\ + (\frac{1}{\sqrt{3}} + 2)^6 - (\frac{1}{\sqrt{3}} + 2)^2 \sin 2(2 + \frac{1}{\sqrt{3}})]$$

$$= 8.2906 - 0.5909 + 293.1168 + \\ 6.0035$$

$$\int_1^3 f(x) dx = 306.82$$

(e) Gauss Quadrature three point formula.

3 Point formula 3

$$\int_{-1}^1 f(x) dx \approx \frac{5}{9} f(-\sqrt{\frac{3}{5}}) + \frac{8}{9} f(0) + \frac{5}{9} f(\sqrt{\frac{3}{5}}) \quad (6)$$

By transforming the given interval

$$\int_0^1 g(t) dt \text{ having eq. ①}$$

$$\Rightarrow \int_1^3 f(x) dx = \frac{(3-1)}{2} \int_{-1}^1 f(t+2) dt$$

$$= 1 \times \int_{-1}^1 (t+2)^6 - (t+2)^2 \sin 2(t+2) dt$$

e.g.

$$(b) \Rightarrow \int_{-1}^3 f(x) dx = \left[ \frac{5}{9} [(-\sqrt{\frac{3}{5}} + 2)^6 - (-\sqrt{\frac{3}{5}} + 2)^2 \sin 2(-\sqrt{\frac{3}{5}} + 2)] + \frac{8}{9} [(0+2)^6 - (0+2)^2 \sin 2(0+2)] + \frac{5}{9} [(\sqrt{\frac{3}{5}} + 2)^6 - (\sqrt{\frac{3}{5}} + 2)^2 \sin 2(\sqrt{\frac{3}{5}} + 2)] \right]$$

$$= \frac{5}{9} (2.4292) + \frac{8}{9} (67.0292) +$$

$$\frac{5}{9} (461.4028)$$

$$= 317.2642$$

to 6 places of decimal

Actual value is 317.2642

Method of solution

(i) is a method of

More digits will be added if  
1 more digit be in G.F.

Ans: 317.2642

Q6. List the Legendre Polynomials  $P_n(x)$  for  $n=0, 1, 2, 3$  and find their roots. Verify that each  $P_n(x)$  is

- (a) Roots are distinct
- (b) Roots lie within interval  $(-1, 1)$
- (c) Roots are symmetric with respect to origin.

Ans

Legendre Polynomials for  $n=0, 1, 2$

$\rightarrow$  for  $n=0$ ,  $P_0(x)=1$

There is no root for  $P_0(x)$

$\rightarrow$  for  $n=1$ ,  $P_1(x)=x$

$$\text{Then } \int_{-1}^1 f(x) dx = w_1 f(s_1)$$

It should give exact result when  $f(x)$  is of degree 1

$\therefore$  let  $f(x)=1$ .

$$\therefore \int_{-1}^1 dx = w_1 \Rightarrow w_1 = [x]_{-1}^1 = 2$$

Let  $f(x) = x$

$$\therefore \int_{-1}^1 x dx = w_1 x_1$$

$$\Rightarrow \left[ \frac{x^2}{2} \right]_{-1}^1 = w_1 x_1$$

$$\therefore w_1 x_1 = \frac{1}{2} - \frac{1}{2} = 0$$

e.g

$$\textcircled{1} \Rightarrow$$

$$x^2 - 2x + 1 = 0 \Rightarrow x_1 = 1$$

Roots of  $P_1(x)$  is  $x_1 = 0$  which  
is distinct,  $-1 < 0 < 1$  and on  
origin

$$\Rightarrow \text{for } n=2, P_2(x) = \frac{3x^2 - 1}{2}$$

$$\text{Here } \int_{-1}^1 f(x) dx = w_1 f(x_1) + w_2 f(x_2)$$

$$\text{let } f(x) = 1 \Rightarrow w_1 + w_2 = \int_{-1}^1 1 dx = [x]_{-1}^1 = 2$$

$$f(x) = x \Rightarrow v_1 x_1 + v_2 x_2 = \int_{-1}^1 x dx =$$

$$\left[ \frac{x^2}{2} \right]_{-1}^1 = \left[ \frac{1}{2} - \frac{1}{2} \right] = 0$$

$$f(x) = x^2 \Rightarrow v_1 x_1^2 + v_2 x_2^2 = \int_{-1}^1 x^2 dx$$

$$\left[ \frac{x^3}{3} \right]_{-1}^1 = \frac{2}{3}$$

$$f(x) = x^3 \Rightarrow v_1 x_1^3 + v_3 x_2^3 = \int_{-1}^1 x^3 dx =$$

$$\left[ \frac{2x^4}{5} \right]_{-1}^1 = \frac{1}{5} - \frac{1}{5} = 0$$

By solving above equation, we get the roots

$$x_1 = \frac{1}{\sqrt{3}} \text{ and } x_2 = -\frac{1}{\sqrt{3}}$$

$$\rightarrow \text{for } n=3, P_3(x) = \frac{(5x^3 - 3x)}{3}$$

$$\text{here } \int_{-1}^1 f(x) dx = w_1 f(x_1) + w_2 f(x_2) \\ + w_3 f(x_3)$$

let

$$f(x) = 1 \Rightarrow w_1 + w_2 + w_3 \geq 2$$

$$f(x) = x \Rightarrow w_1 x_1 + w_2 x_2 + w_3 x_3 = 0$$

$$f(x) = x^2 \Rightarrow w_1 x_1^2 + w_2 x_2^2 + w_3 x_3^2 =$$

$$\frac{2}{3}$$

$$f(x) = x^3 \Rightarrow w_1 x_1^3 + w_2 x_2^3 + w_3 x_3^3 = 0$$

$$f(x) = x^4 \Rightarrow w_1 x_1^4 + w_2 x_2^4 + w_3 x_3^4 = \frac{2}{5}$$

$$f(x) = x^5 \Rightarrow w_1 x_1^5 + w_2 x_2^5 + w_3 x_3^5 = 0$$

$\therefore$  solving above equation, root  
 $x_1, x_2, x_3$  are

$$x_1 = -\sqrt{\frac{3}{5}}, x_2 = 0, x_3 = \sqrt{\frac{3}{5}}$$

→ Here all are distinct,  $\forall i = 1, 2, 3$

-1 <  $x_i < 1$  and roots are symmetric with respect to origin

→ For  $n=2$  roots  $x_1 = -\frac{1}{\sqrt{3}}$

and  $x_2 = \frac{1}{\sqrt{3}}$  are also distinct,  
both are between -1 to 1 and  
both are symmetric.

Q7 Calculate calculate  $\int_{-3}^3 \frac{x}{\sqrt{1-x^2}} dx$  using

(1) 2 point Gauss quadrature formula.

Ans We need to transform the given integral to  $\int_{-1}^1 g(t) dt$

The two point Gaussian quadrature formula is

$$\int_{-1}^1 f(x) dx = f\left(-\frac{1}{\sqrt{3}}\right) + f\left(\frac{1}{\sqrt{3}}\right) \quad \text{--- (1)}$$

Let  $t = \frac{x-a}{b-a}$

$$\int_a^b f(x) dx = \frac{b-a}{2} \int_{-1}^1 f\left(\frac{b-a}{2} + \frac{a+b}{2}\right) dt$$

$$\left. \frac{b-a}{2} \right|_{-1}^1 dt$$

Here  $a=3$ ,  $b=3$ , i.e.,  $f(x) = \frac{x}{\sqrt{x^2-4}}$

$$x = \frac{3+5-3}{2} t + \frac{3+5+3}{2}$$

$$= \frac{0.5}{2} + \frac{6.5}{2}$$

$$\int_{-3}^{3.5} f(x) dx = \left( \frac{3.5 - 3}{2} \right) \int_{-1}^1 f\left(\frac{0.5}{2}t + \frac{6.5}{2}\right) dt \quad \text{--- (1)}$$

$$= 0.25 \int_{-1}^1 f(0.25t + 3.25) dt$$

$$= 0.25 \int_{-1}^1 \frac{(0.25t + 3.25)}{\sqrt{(0.25t + 3.25)^2 - 4}} dt$$

$$= 0.25 \left[ \frac{(0.25 \times (-\frac{1}{\sqrt{3}}) + 3.25)}{\sqrt{0.25 \times \frac{1}{\sqrt{3}} + 3.25}} \right] - 4$$

$$+ \frac{(0.25 \times \frac{1}{\sqrt{3}} + 3.25)}{\sqrt{(0.25 \times \frac{1}{\sqrt{3}} + 3.25)^2 - 4}}$$

$$= 0.25 [1.3071 + 1.2377]$$

$$= 0.63619$$

② 3 Point Gauss Quadrature  
Formula.

$$\int_{-1}^1 f(x) dx \approx \frac{5}{9} f(-\sqrt{\frac{3}{5}}) + \frac{8}{9}$$

$$f(0) + \frac{5}{9} f(\sqrt{\frac{3}{5}}) \quad \text{--- (2)}$$

By transforming given interval

to  $\int_{-1}^1 g(t) dt$  we have

e.g.

$$\textcircled{1} \Rightarrow \int_{-3.5}^{3.5} f(x) dx =$$

$$\left( \frac{-3.5 - 3}{2} \right) \int_{-1}^1 (0.25 t + 3.25) dt$$

$$= 0.25 \int_{-1}^1 (0.25 t + 3.25) dt$$

$$= 0.25 \int_{-1}^1 \frac{(0.25 t + 3.25)}{\sqrt{(0.25 t + 3.25)^2 - 4}} dt$$

eq.

$$\textcircled{2} \Rightarrow \int_3^{\frac{3}{\sqrt{3}}} f(x) dx =$$

$$0.25 \left[ \frac{8}{9} \left( 0.25x - \sqrt{\frac{3}{5}} + 3.25 \right) \right]$$

$$\sqrt{(0.25x - \sqrt{\frac{3}{5}} + 3.25)^2} - 4$$

$$+ \frac{8}{9} \frac{(0.25x_0 + 3.25)}{\sqrt{(0.25x_0 + 3.25)^2} - 4}$$

$$+ \frac{5}{9} \frac{(0.25x \times \sqrt{\frac{3}{5}} + 3.25)}{\sqrt{(0.25x \times \sqrt{\frac{3}{5}} + 3.25)^2} - 4}$$

$$= 0.25 [0.7347 + 1.1277 + 0.6825]$$

$$= 0.63621$$

Q8 Determine constants  $a, b, c, d$   
that will produce a quadrature formula.

$$\int_{-1}^1 f(x) dx = af(-1) + bf(1) + cf'(-1) + df'(1)$$

That has degree of precision 3.

Ans.

Using method of undetermined coefficient

$$\text{Let } f(x) =$$

$$\therefore f(-1) = 1; f(1) = 1; f'(-1) =$$

$$\frac{d}{dx} f(1) = 0, f'(1) = \frac{d}{dx} f(1) = 0$$

$$\therefore \int_{-1}^1 dx = [x]_{-1}^1 = 2 = a \cdot 1 + b \cdot 1 + c \cdot 0 + d \cdot 0 \quad \text{①}$$

→ let  $f(x) = x^2$

$$\therefore f(-1) = -1, f(1) = 1,$$

$$f'(-1) = \frac{d(x)}{dx} = 1, f'(1) = \frac{d(x)}{dx} = 1$$

$$\therefore \int_{-1}^1 x^2 dx = \left[ \frac{x^3}{3} \right]_{-1}^1 = 0 = a \cdot -1 + b \cdot 1$$

C. 1 + d. 1

(2)

→ let  $f(x) = x^2$

$$\therefore f(-1) = 1, f(1) = 1, f'(-1) = \frac{d(x)}{dx}$$

$$\therefore f'(-1) = -2, f'(1) = \frac{d(x)}{dx} = 2$$

$$\therefore \int_{-1}^1 x^2 dx = \left[ \frac{x^3}{3} \right]_{-1}^1 = \frac{2}{3} = a \cdot -1 + b \cdot 1$$

C. -2 + d. 2

(3)

→ let  $f(x) = x^3$

$$\therefore f(-1) = -1, f(1) = 1, f'(-1) = \frac{d}{dx}(x^3)$$

$$= 3x^2 = 3(-1)^2 = 3,$$

$$f'(1) = 3(1)^2 = 3$$

$$\therefore \int_{-1}^1 x^3 dx = \left[ \frac{x^4}{4} \right]_{-1}^1 = 0 = a - 1$$

$$+ b \cdot 1 + c \cdot 3 + d \cdot 3 \quad \text{--- (4)}$$

∴ we have 4 equation

$$a + b = 2 \quad \text{--- (1)}$$

$$-a + b + c + d = 0 \quad \text{--- (2)}$$

$$a + b - 2c + 2d = \frac{2}{3} \quad \text{--- (3)}$$

$$-a + b + 3c + 3d = 0 \quad \text{--- (4)}$$

$$(1, 3) \Rightarrow 2 - 2c + 2d = \frac{2}{3}$$

$$\therefore 2(1 - c + d) = \frac{2}{3}$$

$$\therefore 1 - c + d = \frac{1}{3}$$

$$\therefore -c + d = \frac{1}{3} - 1$$

$$\therefore -c + d = \frac{1}{3} - 1$$

$$\therefore -c + d = -\frac{2}{3}$$

$$\therefore c - d = \frac{2}{3}$$

$$\therefore c = \frac{2}{3} + d \quad \textcircled{5}$$

$$\textcircled{1} \Rightarrow a = 2 - b$$

$$\therefore \textcircled{2} \Rightarrow -(2 - b) + b + c + d = 0$$

$$-2 + 2b + c + d = 0$$

$$2b + c + d = 2$$

$$\textcircled{5} \Rightarrow 2b + \frac{2}{3} + d = 2$$

$$\therefore 2b + \frac{2}{3} + d = 2$$

$$b + \frac{1}{3} + d = 1$$

$$\therefore b + d = 1 - \frac{1}{3}$$

$$\therefore b + d = \frac{2}{3} \quad \textcircled{6}$$

$$④ \Rightarrow - (2 - b) + b + 3 \left( \frac{2}{3} + d \right) + \\ 3d = 0$$

$$\therefore -2 + b + b + 2 + 3d + 3d = 0$$

$$\therefore -2 + 2b + 6d + 2 = 0$$

$$\therefore -1 + b + 3d + 1 = 0$$

$$\therefore b + 3d = 0 \quad \text{--- } ⑤$$

$$④ - ⑤ \rightarrow b + d = \frac{2}{3}$$

$$b + 3d = 0$$

$$-2d = \frac{2}{3}$$

$$d = -\frac{1}{3} \quad \text{--- } ⑥$$

$$⑤ \Rightarrow c = \frac{2}{3} + d = \frac{2}{3} - \frac{1}{3}$$

$$c = \frac{1}{3} \quad \text{--- } ⑦$$

$$\textcircled{6} \Rightarrow b+d = \frac{2}{3}$$

$$\therefore b - \frac{1}{3} = \frac{2}{3}$$

$$\therefore b = \frac{2}{3} + \frac{1}{3} = \frac{3}{3}$$

$$\therefore b = 1 \quad \text{--- } \textcircled{10}$$

$$\textcircled{1} \Rightarrow a+b=2$$

$$a+b=2 \quad \text{--- } \textcircled{2-a}$$

$$\therefore a = 1 \quad \text{--- } \textcircled{11}$$

$$\therefore a = 1$$

$$\therefore b = 1$$

$$\therefore c = \frac{1}{3}$$

$$\therefore d = -\frac{1}{3}$$

Q9

Derive mid point formula using method of Undetermined Coefficients

Ans

Let  $n=1$  in method of undetermined coefficients

$$\therefore \int_a^b f(x) dx \approx w_1 f(x_1)$$

It gives exact result when  $f(x)$  is of degree  $\leq 2x^1 - 1 = 1$

$$\therefore \text{Let } f(x) = 1 \text{ & } f(x) = x$$

for  $f(x) = 1$ ,  $\int_a^b 1 dx = w_1 \Rightarrow$

$$w_1 = b - a \quad \text{--- (1)}$$

for  $f(x) = x$ ,  $\int_a^b x dx = w_1 \cdot 1$ ,

$$\Rightarrow w_1 \cdot 1 = \frac{1}{2} (b^2 - a^2) \quad \text{--- (2)}$$

$$\textcircled{1} \quad \Rightarrow \quad x_1 = \frac{1}{2}(b+a)$$

The resulting Gaussian quadrature formula is

$$\int_a^b f(x) dx \approx (b-a) f\left(\frac{a+b}{2}\right)$$

which is same as midpoint rule.

## Numerical methods

Q1 Define a differential equation.

What is meant by solution of a differential equation? Verify that

(i)  $y = C_1 e^x + C_2 e^{-x}$  is a solution of the differential  $y'' - 2y' + y = 0$ .

(ii)  $y = 2 \sqrt{C-x}$  is a solution of the differential equation  $y' + \frac{1}{y} = 0$ .

Ans Define a differential eq.

→ A differential equation is an equation involving independent variable, dependent variable and its one or more derivatives

ex

$$y'' + y = 0$$

Here  $y$  is dependent variable,  
 $y$  is function of  $x$

⇒ Solution of differential equation

A solution of a differential equation is a specific function

that satisfies the equation.

(i) Her differential equation,

$$y'' - 2y' + ty = 0 \quad (1)$$

$$\text{let } y(x) = C_1 e^x + (C_2 x e^x) \quad (1)$$

$$y'(x) = C_1 e^x + (C_2 \frac{d}{dx}(x e^x))$$

$$= C_1 e^x + (C_2 (e^x x + e^x))$$

$$\frac{d}{dx}(x)$$

$$= C_1 e^x + (C_2 (x e^x + e^x))$$

$$y'(x) = C_1 e^x + C_2 e^x + (C_2 x e^x) \quad (2)$$

$$y''(x) = C_1 e^x + C_2 e^x + (C_2 (e^x + x e^x))$$

$$y''(x) = C_1 e^x + 2(C_2 e^x) + (C_2 x e^x) \quad (3)$$

Substituting (1) (2) & (3) in (1),

$$0 = C_1 e^x + 2(C_2 e^x) + (C_2 x e^x) - 2(C_1 e^x)$$

$$(C_2 e^x + (C_2 x e^x)) + (C_1 e^x + (C_2 x e^x))$$

$$\begin{aligned}
 &= 2C_1 e^x + 2C_2 e^x + 2C_2 x e^x \\
 &- 2C_1 e^x - 2C_2 e^x - 2C_2 x e^x \\
 &\equiv 0
 \end{aligned}$$

$\therefore y = C_1 e^x + C_2 x e^x$  is a solution

$$\text{of } y'' - 2y' + y = 0$$

(ii) Here differential between equation is  $y' + \frac{1}{y} = 0$

$$\text{Let } y = 2\sqrt{c-x} = 2(c-x)^{\frac{1}{2}} \quad \text{--- (1)}$$

$$y' = 2 \times \frac{1}{2} (c-x)^{\frac{1}{2}-1} \times \frac{d}{dx}(c-x)$$

$$= (c-x)^{\frac{1}{2}} \times -1 = -\frac{1}{\sqrt{c-x}} \quad \text{--- (2)}$$

$$\text{②} \Rightarrow \frac{-1}{\sqrt{c-x}} + \frac{1}{2\sqrt{c-x}} \neq 0$$

$\therefore y = 2\sqrt{c-x}$  is not a soln.

$$\text{of } y' + \frac{1}{y} = 0$$

Q2 how is ordinary differential equation different from Partial differential equation? Give one example of each.

Anc.

When dependent variable is a function of only one variable, then all the derivatives involved in the equation are ordinary and the equation is called ordinary differential equation.

- if dependent variable is a function of more than one independent variable, that is, it is a function of several variables, then the equation contains partial derivations with respect to different independent variables and the equation is called Partial Differential Equations.

⇒ Example of ordinary

$$y'' + by = 0$$

$$y' + y = 0$$

⇒ Example of Partial

$$\frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} = 0 \quad (\text{Laplace's Eq})$$

$$\frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} = f(x, y) \quad (\text{Poisson's Eq})$$

Q3 Differentiate between initial value problem and Boundary value problem. classify following differential equation in initial value problem and Boundary value problem.

Anc.

→ If the condition are specified at a single point these condition are called initial condition and the differential eq combined with conditions is called initial value problem.

2 If the condition are specified at more than one point these condition are called Boundary condition and the differential Eq combined with conditions is called Boundary value problem

$$(i) y' = t - y, y(0) = 1$$

→ Initial Value Problem

$$(ii) y'' + 9y = e^t \sin 3t, y(0) = 1, y'(0) = 2$$

→ Boundary Value Point problem

$$(iii) y'' + y = 0, y(0) = 0, y'(0) = 2$$

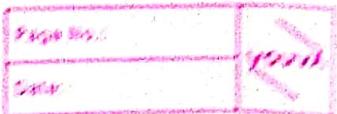

→ Boundary Value Point problem

$$(iv) y'' + y' = t^2 + y^2, y(0) = 1, \\ y'(0) = 1$$

→ Boundary Value Point problem

$$(v) y' = t^2 + y^2, y(0) = 1$$

→ Initial Value problem

Ques. determine Order and degree  
of following differential eq.

Ans (i)  $y'' + 4y = e^x$

→ order = 2, degree = 1

(ii)  $y'' + 4(y')^3 + y^2 = x^3 + y^2$

→ order = 2, degree = 1

(iii)  $(y'')^2 + (y')^3 + 3y = 5x$

→ order = 2, degree = 2

(iv)  $y' + 2y^2 = x^2$

→ order = 1, degree = 1

Q5. What are the characteristics of single step numerical methods to find solution of first order, first degree IVP?

Ans. These are the characteristics of single step numerical methods.

- ① It is direct
- ② It is non iterative
- ③ It is based on Taylor series method.
- ④ It is used estimating at previous step & function information.
- ⑤ Practically, error cannot be estimated.

Q6 Differentiate between single step and multistep numerical methods to obtain solution of IVP.

Ans

### Single Step methods

→ Direct

→ Not iterative

→ Based on Taylor Series method

→ Self starting.

→ Practically, accuracy cannot be estimated.

### Multistep method

→ More than one previous step

→ Iterative.

→ Predictor Corrector formulas.

→ Not self starting

→ Practically, accuracy can  
be estimated.

## Ordinary Differential Equations-II

Q1

A ball at 1200K is allowed cool down in air at an ambient temperature of 300K. Assuming heat is lost only due to radiation, the differential equation for temperature of the ball is given by  $\frac{d\theta}{dt} = -2.2067 \times 10^{-12} (\theta^4 - 81 \times 10^8)$

$$\theta(0) = 1200K$$

When  $\theta$  is in K and  $t$  in seconds. Find the temperature at  $t = 480$  seconds using Runge Kutta 2<sup>nd</sup> order method. Assume a step size of  $h = 240$  seconds.

Ans

Runge Kutta formulas of order 2 is  $\frac{dy}{dx} = f(x, y(x))$ ,  $y(x_0) = y_0$

$$a \leq x \leq b$$

$$y_{i+1} = y_i + \frac{h}{2} (k_0 + k_1) \text{ with}$$

$$k_0 = h f(x_i, y_i)$$

$$k_1 = h f(x_i + h, y_i + k_0) \text{ for } i = 0, 1, 2, \dots, n$$

$\Rightarrow$  Here we have  $\frac{d\theta}{dt} = f(t, \theta)$

$$\Rightarrow -2.2067 \times 10^{-12} (\theta^5 - 81 \times 10^8),$$

$$t_0 = 0$$

$$\theta_0 = \theta(0) = 1200 \text{K}, \quad 0 \leq t \leq 480,$$

$$h = 240 \text{ sec.}$$

$$\text{Let } t_1 = 240, \quad t_2 = 480$$

$$\therefore \theta_1 = \theta_0 + \frac{1}{2} (k_0 + k_1) \quad \textcircled{1}$$

$$k_0 = 240 \times f(t_0, \theta_0) = 240 \times f(0, 1200)$$

$$= 240 \times (-2.2067 \times 10^{-12} \times (1200)^5 \\ - 81 \times 10^8)$$

$$k_0 = -1093.903 \quad \textcircled{2}$$

$$k_1 = h \times f(t_0 + h, \theta_0 + k_0)$$

$$= 240 \times f(240, 1200 + (-1093.903))$$

$$= 240 \times f(240, 106.104)$$

$$= 240 \times (-2.2067 \times 10^{-12} \times \\ (106.104)^5 - 81 \times 10^8)$$

$$k_1 = 4.2227 \quad \text{--- ②}$$

Substituting eq ①, ② & ③

$$\theta_1 = 1200 + \frac{1}{2} (-1093.905 + 4.2227)$$

$$\theta_1 = 655.1587 \quad \text{--- ④}$$

$\rightarrow$  now  $t_2 = 400 \text{ sec}$

$$\theta_2 = \theta_1 + \frac{1}{2} (k_0 + k_1)$$

$$k_0 = h f(t_1, \theta_1) \quad \text{⑤}$$

$$= 240 \times f(400, 655.1587)$$

$$k_0 = -93.2856$$

$$k_1 = h f(t_1 + h, \theta_1 + k_0)$$

$$= 240 \times f(480, 655.1587 + (-93.2856))$$

$$= 240 \times (-2.2007 \times 10^{-12} (561.87) - 81 \times 10^8)$$

$$k_1 = -48.4998$$

$$A_2 = 655.1582 + \frac{1}{2}(-93.2856 - 48.4948)$$

$$\theta_2 = 584.2685 \text{ k} \quad \underline{\underline{\theta}}$$

Q2

use Taylor's method of order 2  
to approximate the solutions of  
each of the following problems.

$$\text{Q} @ \frac{dy}{dx} = y - x^2 + 1, y(0) = 0.5, h = 0.5$$

Ans

$$\text{Here } \frac{dy}{dx} = y' = y - x^2 + 1, x_0 = 0, \\ y_0 = 0.5, 0 \leq x \leq 2, h = 0.5$$

$\rightarrow$  at  $x_1 = 0.5$  by Taylor's  
method of order 2

$$y_{i+1} \approx y_i + hy'_i + \frac{h^2}{2!} y''_i$$

$$\text{Here } y' = y - x^2 + 1$$

$$\therefore y'' = \frac{d}{dx} y' = \frac{d}{dx} (y - x^2 + 1) = -2x$$

$$\therefore y_1 = y_0 + hy' + \frac{h^2}{2!} y''_0$$

$$= 0.5 + 0.5 (y_0 - x_0^2 + 1) +$$

$$\frac{(0.5)^2}{2!} (-2x_0)$$

$$= 0.5 + 0.5(0.5 - 0 + 1) + \frac{(0.5)^2}{2!}$$

$$(-2x_0)$$

$$y_1 = 1.25 \quad \text{--- } ①$$

$$\rightarrow a + x_2 = 1$$

$$y_2 = y_1 + h y_1' + \frac{h^2}{2!} y_1''$$

$$= 1.25 + 0.5(1.25 - (0.5)^2 + 1) +$$

$$\frac{(0.5)^2}{2!} (-2x_1)$$

$$= 1.25 + 0.5(1.25 - (0.5)^2 + 1)$$

$$+ \frac{0.25}{2} (-2 \cdot (0.5))$$

$$y_2 = 2.125 \quad \text{--- } ②$$

$$\rightarrow a + x_3 = 1.50$$

$$y_3 = y_2 + h y_2' + \frac{h^2}{2!} y_2''$$

$$= 2.125 + 0.5 (y_2 - x_2^2 + 1) \frac{(0.5)^2}{2!} (-x_2)$$

$$= 2.125 + 0.5 (2.125 - 1^2 + 1) + \frac{0.25}{2} (-2(1))$$

$$y_3 = 2.9375 \quad \text{--- } ③$$

$$a + x_3 = 1$$

$$y_4 = y_3 + h y_3' + \frac{h^2}{2!} y_{3''}$$

$$= 2.9375 + 0.5 (y_3 - x_3^2 + 1) + \frac{(0.5)^2}{2!} (-2x_3)$$

$$= 2.9375 + 0.5 (2.9375 - (1.5)^2 + 1) + \frac{0.25}{2} (-2(-1.5))$$

$$\boxed{y_4 = 3.40625}$$

$$(b) \frac{dy}{dt} = \cos 2t + \sin 3t, \quad 0 \leq t \leq 1,$$

$$y(0) = 1, \quad h = 0.25$$

Ans Next  $\frac{dy}{dt} \approx y' = \cos 2t + \sin 3t$ ,

$$y_0 = 1, \quad t_0 = 0, \quad h = 0.25$$

$$y' = \cos 2t + \sin 3t$$

$$y'' = -2 \sin 2t + 3 \cos 3t$$

$\Rightarrow a + t_1 = 0.25$ , Using Taylor method  
of order 2.

$$y_1 = y_0 + h y' + \frac{h^2 y''}{2!}$$

$$= 1 + 0.25(\cos 0 + \sin 0) +$$

$$\frac{0.0625}{2} (-2 \sin 0 + 3 \cos 0)$$

$$y_1 = 1.34375 \quad \text{--- (1)}$$

$$\Rightarrow a + t_2 = 0.5$$

$$y_2 = y_1 + h y'_1 + \frac{h^2}{2!} y''_1$$

$$= 1.34373 + 0.25 (\cos 0.5 + \sin 0.5)$$

$$+ \frac{0.0625}{2} (-2 \sin 0.5 + 3 \cos 0.5)$$

$$y_2 = 1.7722 \quad \textcircled{2}$$

$$\rightarrow a + t_3 = 0.95$$

$$y_3 = 1.7722 + (0.25) (\cos 1.5 + \sin 1.5) + \frac{0.0625}{2} (-2 \sin 1.5 + 3 \cos 1.5)$$

$$y_3 = 2.1107 \quad \textcircled{3}$$

$$a + t_n = 1$$

$$y_4 = 2.1107 + (0.25) (\cos 2.25 + \sin 2.25) + \frac{0.0625}{2} (-2 \sin 2.25 + 3 \cos 2.25)$$

$$\boxed{y_4 = 2.20167}$$

$$\textcircled{O} \quad y' = \frac{1+t}{1+y}, \quad 1 \leq t \leq 2, \quad y(1)=2 \\ h=0.5$$

Ans  
Here

$$t_0 = 1, \quad y_0 = 2, \quad 1 \leq t \leq 2, \\ h = 0.5$$

~~y<sup>dt</sup>~~

$$y' = \frac{1+t}{1+y}, \quad y'' = \frac{1}{1+y} \frac{d(1+y)}{dt} = \frac{1}{1+y}$$

using Taylor's method of order

$$\text{at } t_1 = 1.5$$

$$y_1 = y_0 + h y'_0 + \frac{h^2}{2!} y''_0$$

$$= 2 + 0.5 \left( \frac{1+t_0}{1+y_0} \right) + \frac{(0.5)^2}{2}$$

$$\left( \frac{1}{1+y_0} \right)$$

$$= 2 + 0.5 \left( \frac{1+1}{1+2} \right) + \frac{0.25}{2} \left( \frac{1}{1+2} \right)$$

$$y_1 = 2.325$$

$$\rightarrow a + b_2 = 2$$

$$y_2 = y_1 + hy_1' + \frac{h^2}{2!} y_1''$$

$$= 2.375 + 0.5 \left( \frac{1+1.5}{1+2.375} \right) + 0.125$$

$$\left( \frac{1}{1+2.375} \right)$$

$$\boxed{y_2 = 2.7824}$$

$$\textcircled{1} \quad y' = 1 + \frac{y}{t}, \quad y(1) = 1, \quad h = 0.25 \\ 1 \leq t \leq 1.5$$

In next,  $t_0 = 1, y_0 = 1, h = 0.25$ ,  
 $1 \leq t' \leq 1.5$

$$y' = 1 + \frac{y}{t}, \quad y'' = y \frac{d}{dt} \left(\frac{1}{t}\right) = \\ y \frac{d}{dt} \left(t^{-1}\right)$$

$$\therefore y'' = -\frac{y}{t^2}$$

$$a + t_1 = 1.25$$

$$y_1 = y_0 + h y'_0 + \frac{h^2}{2!} y''_0$$

$$= 1 + (0.25) \left(1 + \frac{y_0}{t_0}\right) +$$

$$\frac{0.25^2}{2} \cdot \left(-\frac{y_0}{t_0^2}\right)$$

$$= 1 + 0.25 \left(1 + \frac{1}{1}\right) + \frac{0.0625}{2}$$

$$\left(-\frac{1}{1}\right)$$

$$y_1 = 1.16875 \quad \text{--- } \textcircled{1}$$

$$a + t_2 = 1.50$$

$$y_2 = y_1 + h y'_1 + \frac{h^2}{2!} y''_1$$

$$= 1.46875 + 0.25 \times \left( 1 + \frac{1.46875}{1.25} \right)$$

$$+ 0.03125 \left( -\frac{1.46875}{(1.25)^2} \right)$$

$$\boxed{Ty_2 = 1.983125} \quad \textcircled{2}$$

$$\textcircled{P} \quad y' = x e^{y+x-1}, \quad y(0) = -1, \quad h = 0.5$$

Ans here

$$y_0 = -1, \quad x_0 = 0, \quad h = 0.5,$$

$$0 \leq x \leq 1$$

$$y' = x e^{y+x-1}, \quad y'' = x \frac{d}{dx} (e^y + x)$$

$$+ e^y + x \frac{d}{dx} x$$

$$y'' = x e^{y+x} + e^{y+x}$$

$$\rightarrow a + x_1 = 0.5$$

$$y_1 = y_0 + h y'_0 + \frac{h^2}{2!} y''_0$$

$$= -1 + 0.5(x_0 \times e^{y_0+x_0-1})$$

$$+ \frac{0.5^2}{2} (x_0 e^{y_0+x_0} + e^{y_0+x_0})$$

$$\therefore y_1 = -1 + 0.5(0 \times e^{-1+0-1})$$

$$+ \frac{0.25}{2} (0 \times e^{-1+0} + e^{-1+0})$$

$$y_1 = -1.4540 \quad \text{---} \quad ①$$

$$\rightarrow a + x_2 = 1$$

$$y_2 = y_1 + h y'_1 + \frac{h^2}{2!} y''_1$$

$$= -1.4540 + 0.5 (x_1 e^{y_1+x_1} + \frac{0.25}{2} (x_1 e^{y_1+x_1} + e^{y_1+x_1}))$$

$$\boxed{y_2 = 1.7855}$$

Q3

Compare the Performance of Euler's method, second order Taylor's method, Rk of order 2 and Rk order 4 for the following differential eq.

Ans

$$\textcircled{a} \text{ Here } \frac{dy}{dx} = \frac{x}{y}, h=0.5$$

$$y_0 = 1, x_0 = 0, 0 \leq x \leq 2$$

$\Rightarrow$  with Euler's method

$$y_{i+1} = y_i + h f(x_i, y_i)$$

$$y_{i+1} = y_i + 0.5 (x_i/y_i)$$

$$\rightarrow a + x_0 = 0, y_0 = 1$$

$$\rightarrow a + x_1 = 0.5$$

$$y_1 = y_0 + 0.5 \left( \frac{x_0}{y_0} \right) = \\ 1 + 0.5 \left( \frac{0}{1} \right) = 1$$

$$\rightarrow a + x_2 = 1$$

$$y_2 = y_1 + 0.5 \left( \frac{x_1}{y_1} \right) \\ = 1 + 0.5 \left( \frac{0.5}{1} \right) \\ = 1.25$$

$$\rightarrow a + x_3 = 1.5$$

$$y_3 = y_2 + 0.5 \left( \frac{x_2}{y_2} \right) \\ = 1.25 + 0.5 \left( \frac{1}{1.25} \right) \\ = 1.05$$

$$\rightarrow a + x_0 = 2$$

$$\begin{aligned}y_1 &= y_0 + 0.5 \left( \frac{x_0}{y_0} \right) \\&= 1.65 + 0.5 \left( \frac{1.5}{1.65} \right) \\&\approx 2.1045\end{aligned}$$

$\Rightarrow$  Second order Taylor's method.

Qn.

Explain Taylor's method of order n to approximate a solution to differential equation  $y'(x) = f(x, y(x))$ ,  $a \leq x \leq b$ ,  $y(a) = c$ . What are its advantages? Why is it seldom used in practice for computer implementation?

Ans

The Taylor's method of order n is

$$y(x_i) = y_i + (x - x_i) y'_i + \frac{(x - x_i)^2}{2!} y''_i + \dots +$$

$$\frac{(x - x_i)^n}{n!} y_i^{(n)}$$

Using this Taylor series to evaluate  $y'(x_i) = f(x_i, y(x_i))$ ,  $a \leq x \leq b$ ,  $y(a) = c$

$$y_{i+1} = y_i + h y'_i + \frac{h^2}{2!} y''_i + \dots$$

$$+ \frac{h^n}{n!} y_i^{(n)}$$

Where  $y_i^{(n)}$  is for  $n$ th derivation of  $y(x)$  at  $x = x_i$

→ Taylor's Series is seldom used in practical for complex implementation due to requirement of derivation of expression of derivatives and evaluation of their values.

→ Taylor's Series is backbone of direct single step formulas. Euler formula and family of Runge Kutta formula are derived from Taylor Series method.

Q5

Repeat question 2 with Runge-Kutta method of order 2.

Here  $\frac{dy}{dx} = y - x^2 + 1$ ,  $y(0) = 0.5$

$$0 \leq x \leq 2, h = 0.5$$

$$y_0 = 0.5, x_0 = 0$$

Q7

Give answer to the following  
in one - two sentence.

① What is the advantage of Rk  
method over Taylor series method  
of the same order?

Ans Rk method and Taylor series  
method of the same order are  
equally efficient but Rk methods  
having advantages of no requirement  
of deriving the expressions of  
derivation.

② What is the order of the  
local truncation error in Rk  
method of order 2 and order 4?  
What is the order of global  
truncation error in these methods?

Ans In Rk method of order 2 the  
order of local truncation error  
is  $O(h^3)$  and order of  
global truncation error is  $O(h^2)$

→ In Rk method of order 2 of  
local truncation error is  $O(h^4)$

Date: YOUVA  
and order of global truncation error is  $O(h^4)$ .

Q) Explain the effect of reducing step size in arriving at approximate solution of differential equation at a point.

Reduction in step size yields better results, increases accuracy.

Q) What is the basic difference in method of deriving formula for simple single step methods and multistep methods?

Ans  
Taylor's method is used to derive formula of single step methods while derivation of multistep methods is based on numerical integration of interpolating polynomial fitted at previous step points.

Q) What is the main drawback of multistep method?

Multistep methods are not self

starting.

Q What are the advantages of predictor corrector methods over RK method?

Ans

In Predictor corrector method only  $1/2/3$  function evaluation per step, depending on number of times, corrector formula is applied.

→ whereas in RK methods, 5 function evaluation per step required.

Consider the IVP

$y' = y - t^2 + 1, 0 \leq t \leq 2, y(0) = 0.5$

taking  $h = 0.2$ , exact solution is  
 $y(t) = (t+1)^2 - 0.5$

① Use Milne Simpson Predictor  
 (corrector formula to estimate  
 values at  $y(0.8)$  &  $y(1.0)$ )

Milne Simpson Predictor formula

$$y_{i+1} = y_i - 3 + \frac{4h}{3}(2f_i - f_{i-1}) \\ + 2f_{i-2}$$

$$\rightarrow \text{corrector formula } \hat{y}_{i+1} = y_{i+1} + \frac{h}{3}(f_{i+1} + 4f_i + f_{i-1})$$

now  $y' = y - t^2 + 1, 0 \leq t \leq 2,$   
 $y(0) = 0.5, h = 0.2$

$$\therefore t_0 = 0, t_1 = 0.2, t_2 = 0.4 \\ t_3 = 0.6, t_4 = 0.8, t_5 = 1$$

→ First we have to estimate  
 values at  $t_0 = 0.8$

exact solution is  $y(t) = (t+1)^2$   
 $\text{Or } y = e^t$

so by exact solution

$$t_0 = 0, y_0 = 0 \text{ or}$$

$$t_1 = 0.2, y_1 = 0.8293$$

$$t_2 = 0.4, y_2 = 1.2141$$

$$t_3 = 0.6, y_3 = 1.6489$$

$$t_4 = 0.8, y_4 = 2.1272$$

Now by Milne Simpson  
 Predictor formula.

$$y_4 = y_0 + h \times \frac{2}{3} (2f_3 - f_2 + 2f_1)$$

$$= 0.5 + \frac{0.2667}{2} (2f(t_3, y_3) - f(t_2, y_2) + 2f(t_1, y_1))$$

$$= 0.5 + 0.2667 (2(1.6489 - 0.8293) - (1.2141 - 0.8293) + 2(0.8293 - 0.4))$$

$$y_4 = 0.5 + 0.2667(2 \times 2 - 2.889 - \\ 2 - 0.541 + 2 \times 1.7893)$$

$$y_4 = 2.1275$$

→ Now by Corrector formula

$$f_2) \quad y_4 = y_2 + \frac{0.2}{3} (f_4 + f_4 f_3 + 1 \\ = 1.2141 + 0.0667 (f(0.8, 2.1275) \\ + hf(0.6, 1.6489) + f(0.4, 1.2141))$$

$$y_4 = 2.1277$$

Again using corrector formula

$$y_4 = 1.2141 + 0.0667 (f(0.8, 2.1277) \\ + hf(0.6, 1.6489) + f(0.4, 1.2141))$$

$$\underline{\underline{y_4 = 2.1277}}$$

Now to estimate values at  $y(t_5)$   
i.e. at  $t_5 = 1.0$

By Milne Simpson Predictor  
formula

$$y_5 = y_3 + \frac{4 \times 0.2}{3} (f_2 f_4 - f_3 + 2f_5)$$

$$= 0.8293 + 0.2867 (2f(0.8, 2.1272) - f(0.6, 1.6489) + 2f(0.4, 1.214))$$

$$y_5 = 2.5878$$

now using corrector formula

$$y_5 = y_3 + \frac{0.2}{3} (f_5 + 4f_4 + f_3)$$

$$= 1.6489 + 0.0667 (f(1, 2.5878) + 4f(0.8, 2.1272) + f(0.6, 1.6489))$$

$$y_5 = 2.6378$$

Again,

$$y_5 = 1.6489 + 0.0667 (f(1, 2.6378) + 4f(0.8, 2.1272) + f(0.6, 1.6489))$$

$$y_5 = 2.6411$$

Again

$$\boxed{y_5 = 2.6413}$$

① Use Adams Moulton for steps Predictor Corrector method to arrive at approximate solution at  $y(0.8)$  &  $y(1.0)$ .

Adams Moulton Predictor formula.

$$y_{i+1} = y_i + \frac{h}{24} (5s f_i - s g f_{i-1} + 3s f_i - 2 - g f_i - 3)$$

→ Corrector formula,

$$y_{i+1} = y_i + \frac{h}{24} (g f(x_{i+1}, y_{i+1}) + 1 g f_i - s f_i + h - x)$$

→ we have  $y' = y - (t)^2 + 1$ ,  
 $0 \leq t \leq 2$ ,  $y(0) = 0.5$ ,  $h = 0.2$

→ Now By Exact solution,

$$t_0 = 0, y_0 = 0.5$$

$$t_1 = 0.2, y_1 = 0.8293$$

$$t_2 = 0.4, y_2 = 1.2141$$

$$t_3 = 0.6, y_3 = 1.6489$$

$$t_4 = 0.8, y_4 = 2.1272$$

~~t<sub>5</sub>~~ \*

We have to find  $y(0.8)$   
i.e. at  $t_4 = 0.8$

$$y_4 = y_3 + \frac{0.2}{24} (35f_3 - 5f_2 + 3f_1 - 9f_0)$$

$$y_4 = 2.1273$$

→ By Corrector formula

$$y_4 = y_3 + \frac{0.2}{24} (9f_1(0.8, 2.1273) + 19f_3 - 5f_2 + f_0)$$

$$y_4 = 2.1272$$

Now to find  $y(1.0)$   
i.e. at  $t_5 = 1.0$

By Predictor method.

$$y_5 = y_4 + \frac{0.2}{24} (55f_4 - 35f_3 + 3f_2 - 9f_1)$$

$$y_5 = 2.6409$$

By Corrator Method.

$$y_5 = y_4 + \frac{0.2}{24} \left( 9f(1.0, 2.6409) + 19f_4 - 5f_3 + f_2 \right)$$

$$\boxed{y_5 = 2.64082}$$

- ① Compare the result obtain in
- ② from the exact solution by calculation error.

<u>Any</u>	<u>Milne Simpson</u>	<u>Exact</u>	<u>Error</u>
$y(0.8)$	2.1277	2.1272	0.0005
$y(1.0)$	2.6413	2.6409	0.0323

<u>Adams - Moulton</u>	<u>Exact</u>	<u>Error</u>

Date:

Yousha

Q1

Values for  $f(x) = x e^x$  are given below

$x$	1.8	1.9	2.0	2.1	2.2
$f(x)$	10.889363	12.708199	14.778122	17.148057	19.855630

use all applicable three point formulas and five point formulas to approximate  $f'(2.0)$

Ans

Three Point endpoint formula  

$$f'(x_0) = \frac{1}{2h} [ -3f(x_0) + 4f(x_0+h) - f(x_0+2h) ]$$

Here  $h = 0.1$

so 
$$f'(2.0) = \frac{1}{2} \times (0.1) [ -3f(2.0) + 4f(2.1) - f(2.2) ]$$

$$= \frac{1}{2} [ -3 \times (14.778122) + 4 \times (17.148057) - (19.855630) ]$$

$$f'(2.0) = 22.03216$$

→ Three Point midPoint formula  

$$f'(x_0) = \frac{1}{2h} [ -f(x_0-h) + f(x_0+h) ]$$

$$f'(2.0) = \frac{1}{2} [ -f(1.9) + f(2.1) ]$$

$$= 5[-12.703199 + 17.148957]$$

$$f'(2.0) = 22.22879$$

→ Three Point endPoint formula

$$f'(x_0) = \frac{1}{2h} [f(x_0 - 2h) - 5f(x_0 - h) + 3f(x_0)]$$

$$f'(2.0) = 22.054675$$

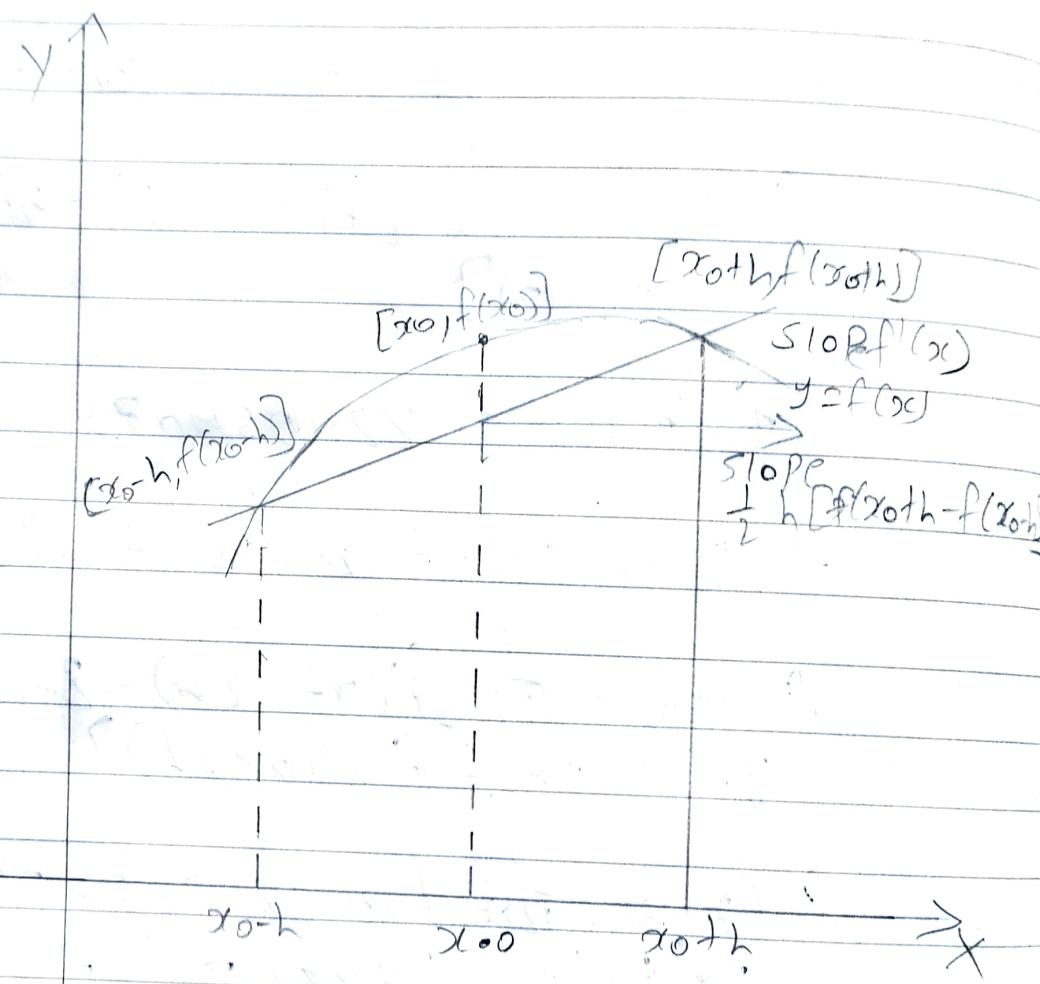

→ Five Point midPoint formula.

$$f'(x_0) = \frac{1}{12h} [f(x_0 - 2h) - 8f(x_0 - h) + 8f(x_0 + h) - f(x_0 + 2h)]$$

$$f'(2.0) = \frac{1}{12x_0} [10.889365 - 8(12.703199) + 8(17.148957) - 19.855030]$$

$$f'(2.0) = 22.1689992$$

Q2 Give graphical representation of three point midpoint formula.

Q3 Explain how  $h$  too small is not advantageous in numerical differentiation.

Ans In each of the numerical differential formulas,  $h$  occurs in denominator. As  $h$  is made smaller and smaller to increase accuracy, division by small number causes round off errors to increase. Moreover in numerator also, difference of almost equal values occurs, which also contributes to round off errors. As a result, beyond a certain value,  $h$  can not be reduced further, as round off errors start dominating and accuracy cannot be improved further.

Q5.

In a circuit with impressed voltage  $E(t)$  and inductance  $L$ , Kirchhoff's first law gives the relationship

$$E(t) = L \frac{di}{dt} + RI,$$

where  $R$  is the resistance in the circuit and  $i$  is the current. Suppose we measure the current for several values of  $t$  and obtain,

$t$	1.00	1.01	1.02	1.03	1.04
$i$	3.10	3.12	3.14	3.18	3.24

Where  $t$  is measured in seconds,  $i$  is in amperes, the inductance  $L$  is a constant 0.98 henries and the resistance is 0.142 ohms. Approximate the voltage  $E(t)$  when  $t = 1.00, 1.01, 1.03, 1.04$ .

Ans

Hence

$$E(t) = L \frac{di}{dt} + RI \text{ where } (0.98)$$

$$L = 0.01, R = 0.142$$

To find  $\epsilon(t)$  at  $t=1.00$  we need to find  $\frac{dy}{dt}$  at  $t=1.00$

By three point end point formula,  
 $f'(x_0) = \frac{1}{2h} [3f(x_0) + 5f(x_0+h) - f(x_0+2h)]$

$$\therefore f'(1.00) = \frac{1}{2 \times 0.01} [-3(3.10) + 5(3.12) - 3.14]$$

$$= 50 \times (0.04) = 2$$

$$\text{So, } \epsilon(1.00) = 0.98 \times 2 + 0.142 \times \frac{1}{(3.10)}$$

$$\epsilon(1.00) = 2.4002 \quad \text{--- (1)}$$

$\rightarrow$  now at  $t=1.01$

By three point midpoint formula,

$$f'(x_0) = \frac{1}{2h} [-f(x_0-h) + f(x_0+h)]$$

$$\therefore f(1.01) = 50[-3.10 + 3.15]$$

$$f(1.01) = 2$$

$$\text{So, } \epsilon(1.01) = 0.98 \times 2 + 0.142 \times \frac{1}{(3.12)}$$

$$= 2.4030 \quad \text{--- (2)}$$

→ now at  $t = 1.02$

By five point midpoint formula,

$$f'(1.0) = \frac{1}{12h} [f(x_0 - 2h) - 8f(x_0 - h) + 8f(x_0 + h) - f(x_0 + 2h)]$$

$$f'(1.02) = \frac{1}{0.12} [3.10 - 8(3.12) + 8(3.18) - (3.24)]$$

$$f'(1.02) = 2.83$$

So

$$E(1.02) = 0.98 \times 2.83 + 0.142 \times (3.14)$$

$$E(1.02) = 3.21928 \quad \text{--- (3)}$$

→ now at  $t = 1.03$

By three point midpoint formula,

$$f'(1.03) = \frac{1}{2x_{0.01}} [-3.14 + 3.24] \\ = 5$$

So

$$E(1.03) = 0.98 \times 5 + 0.142 \times 3.18$$

$$E = 5.35156 \quad \text{--- (4)}$$

Now at  $t = 1.04$   
By three point endpoint  
formula,

$$f'(x_0) = \frac{1}{2h} [f(x_0 + 2h) - 4f(x_0 + h) + 3f(x_0)]$$

$$f'(1.04) = 50 [3.45 - 4(3.18) + (3.24)]$$

$$= 7$$

So

$$\epsilon(1.04) = 0.98 \times 7 + 0.142 \times 3.24$$

$$\epsilon(1.04) = 7.32008 \quad \text{--- (5)}$$
